

NASHUA RIVER  
**WILD & SCENIC**  
STUDY COMMITTEE

Nashua • Squannacook • Nissitissit Rivers

**DRAFT**

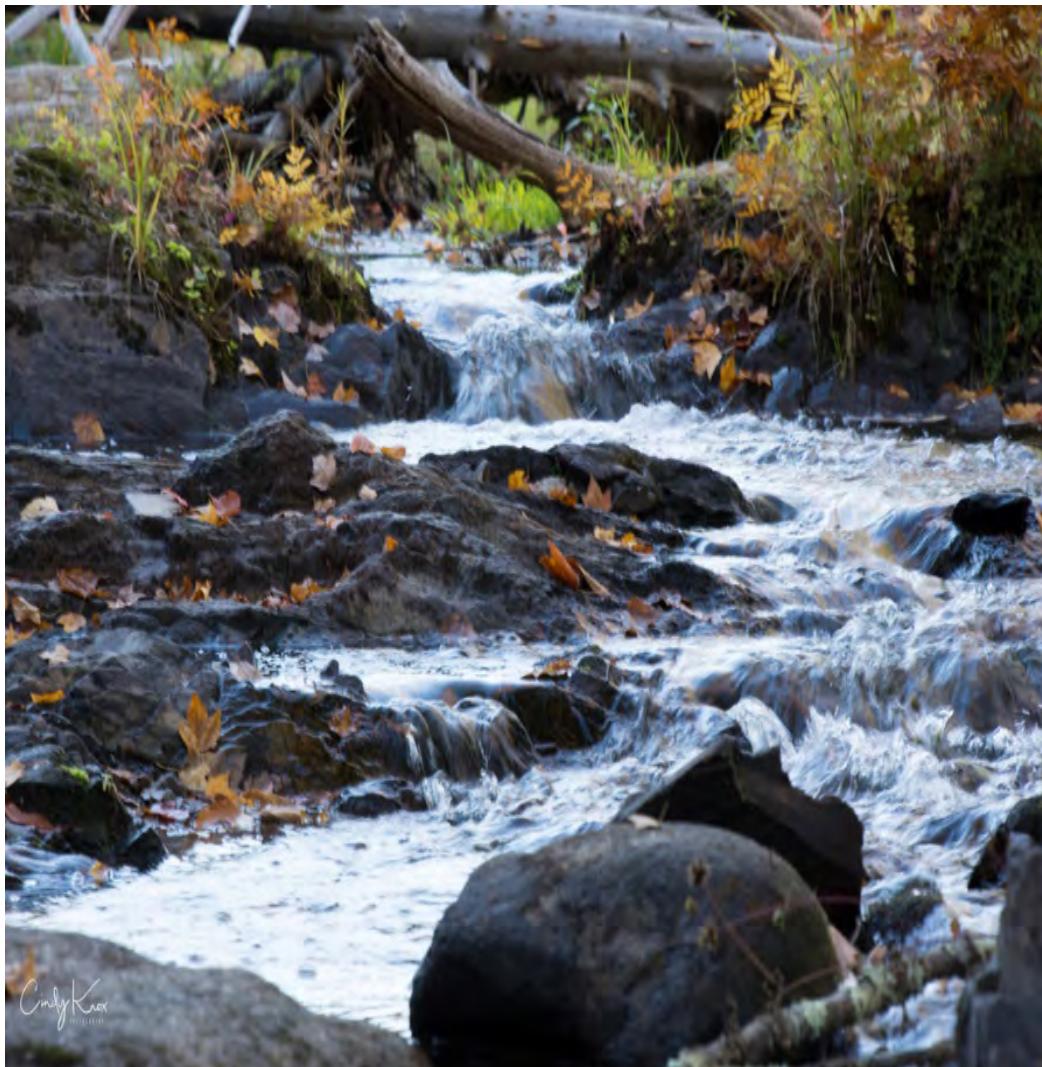

**Nashua,  
Squannacook, and  
Nissitissit Rivers**

**STEWARDSHIP PLAN**

**February 14, 2018**

Some value the river for its enriching qualities, and some for its abundant water power, and some because they can idle away their time in catching pout and pickerel. There are some also who delight in it as a “thing of beauty” and a “joy forever”. They love to wander on its banks, to plunge into its depths and float upon its surface. They return again and again to gaze on its flow when it shimmers in the sun, or is mottled by the rain-drops, or ruffled by the breeze. They are never tired of watching it from some high bank, ...or crumbling bluffs, and see it winding back and forth in the broad valley, like the convolutions of a mighty serpent, gleaming in the light with silvery scales.<sup>1</sup>

The logo for the Nashua River Wild and Scenic River Study Committee was designed by Kristen Mann.

Graphic Design services for the Stewardship Plan were provided by Geralyn Miller Design.

# NASHUA RIVER WILD AND SCENIC RIVER STUDY COMMITTEE

## Voting Entities

Town of Ayer	Beth Suedmeyer and Robert Pontbriand
Town of Bolton	Rona Balco and Rebecca Longvall
Town of Brookline	Jordan Bailey and Drew Kellner
Town of Dunstable	Leah Basbanes and Jean Haight
Town of Groton	Nadia Madden, Vice-chair
Town of Harvard	Lucy Wallace, Chair
Town of Hollis	LeeAnn Wolff and Laura Bianco
Town of Lancaster	Bill Flynn and Susan Munyon
Town of Pepperell	Paula Terrasi and Mark Andrews
Town of Shirley	Heidi Ricci and Betsy Colburn
Town of Townsend	Bill Wilkinson
Nashua River Watershed Association	Elizabeth Ainsley Campbell, Al Futterman, and Martha Morgan
National Park Service	Jamie Fosburgh, Liz Lacy

## Participating Entities

MA Division of Fish and Wildlife	Anne Gagnon
US Fish & Wildlife Service	Tom Eagle
US Geological Survey	Jeff Barbaro
Devens Enterprise Commission	Neil Angus

**Outstandingly Remarkable Resource Value Subcommittee:** Lucy Wallace, Chair; Elizabeth Ainsley Campbell; Betsy Colburn; Mike Fleming; Al Futterman; Anne Gagnon; Warren Kimball; Liz Lacy; Nadia Madden; Martha Morgan; Beth Suedmeyer; Paula Terrasi

**Outreach Subcommittee:** Robert Pontbriand, Chair; Elizabeth Ainsley Campbell; Bill Flynn; Al Futterman; Cindy Knox

**People who served on the Committee in the course of the Study include:** Mark Archambault, former NRWA Smart Growth Circuit Rider; Libby Herland, former Project Leader Eastern Massachusetts NWR Complex US Fish & Wildlife Service; Judy Larter, former Dunstable representative; Tim Purinton, former Director of MA Division of Ecological Restoration

**Questions:**

For questions about the Nashua River Wild and Scenic River Study Committee or this “Nashua, Squannacook, and Nissitissit Rivers Stewardship Plan” please contact:

# Nashua, Squannacook, & Nissitissit Rivers in the Stewardship Plan

February 15, 2018

Greetings—

We are pleased to present the “Nashua, Squannacook, and Nissitissit Rivers Stewardship Plan for your consideration. Three years in the making, the Stewardship Plan is intended as a guide for local communities as they work in partnership to take voluntary actions to protect and enhance outstandingly remarkable resource values of these rivers in the years to come.

The Congressionally-authorized Nashua River Wild and Scenic River Study Committee identified the resources and developed the voluntary Stewardship Plan with much public input. Representatives appointed to the Committee by the eleven participating riverfront towns—Ayer, Bolton, Brookline, Dunstable, Groton, Harvard, Hollis, Lancaster, Pepperell, Shirley, and Townsend—worked together with the Nashua River Watershed Association and National Park Service to explore whether sections of the rivers were eligible and suitable for federal designation as Partnership Wild and Scenic Rivers. Many experts from state agencies and conservation organizations assisted with this effort, and the conclusion is a resounding affirmation that our rivers merit designation.

It is up to the townspeople in the eleven participating communities to vote at their 2018 Spring Town Meetings to accept the Stewardship Plan and its recommendation that the rivers be designated Partnership Wild and Scenic Rivers. If the votes are affirmative, as the Study Committee anticipates, legislation will be submitted to Congress. After designation, a local Stewardship Council will be formed—much like our current Study Committee—to implement the Plan. Designation will not stop development, rezone private land, or change property rights. Land use controls on private lands continue to be solely a matter of state and local jurisdiction.

**Acknowledgements:** We have many people and organizations to thank for their assistance over the past three years, first and foremost the Boards of the participating towns and all those

who served at one point or another on the Study Committee. As can be seen from the lists of Experts Consulted and Reviewers, we have been very fortunate throughout our work to have the benefit of their expertise. We also appreciated being able to consult with leaders of the Stewardship Councils of the New England rivers that have already been designated Wild and Scenic: Eight Mile; Farmington; Lamprey; Sudbury, Assabet, and Concord; Upper Missisquoi and Trout; and Westfield. We appreciated being able to utilize template sections of the plans developed by their Stewardship Council as appropriate.

Many friends from throughout the watershed have contributed a wide variety of photographs. Several individuals have contributed extraordinary pro bono services, including Cindy Knox, who designed our website and provided an initial set of stunning photographs, Diane Carson of Nashoba Paddler, LCC who provided canoes and kayaks for our on-river outreach tours, and Joan Wotkowicz, who helped edit and format the Stewardship Plan.

We greatly appreciate the financial and technical support provided by the National Park Service, including attention from both Liz Lacy, who joined the team more recently, and from Jamie Fosburgh, who has been a tremendous and steady presence since the inception of the project. The Nashua River Watershed Association staff's leadership and diligent work in coordinating the study activities and development of the Stewardship Plan has enabled us to bring this project to fruition, and we especially thank Elizabeth Ainsley Campbell, Al Futterman, and Martha Morgan.

In conclusion, we look forward to hearing from the townspeople at their 2018 Spring Town Meetings when they accept the Stewardship Plan and its recommendation to seek designation for sections of the Nashua, Squannacook, and Nissitissit Rivers as Partnership Wild and Scenic River. Furthermore, we look forward to using this locally driven Stewardship Plan as a guide to voluntary actions that can be taken to protect and enhance our magnificent rivers.

Lucy B. Wallace

Chair, Nashua River Wild and Scenic River Study Committee

## EXECUTIVE SUMMARY

The Nashua, Squannacook, and Nissitissit Rivers are valued by local communities and merit national recognition. This Stewardship Plan (Plan) was created by the locally appointed Nashua River Wild and Scenic River Study Committee during a three-year study that explored the possible designation of the rivers under the National Wild and Scenic Rivers System.

The Plan is intended to guide stewardship of the rivers in the event that they are designated by Congress as Partnership Wild and Scenic Rivers. Through this partnership, many entities representing local, state, and federal interests all voluntarily agree to participate in the Plan's implementation and the realization of its goals. Its implementation through Wild and Scenic designation potentially offers a net financial gain for municipalities and local partners, as costs associated with implementing the Plan can be funded through federal monies (subject to Congressional approval) allotted for that purpose. Regardless of designation, the Plan is intended to be a valuable resource and important tool for citizens, local organizations, and state and local officials concerned with managing, protecting and enhancing the Nashua, Squannacook, and Nissitissit Rivers and the special resources associated with them.

### National Wild and Scenic Rivers System

Congress established the National Wild and Scenic Rivers System in 1968 following a decade of widespread dam building and hydroelectric development. The Wild and Scenic Rivers Act (Public Law 90-542; 16 U.S.C. 1271) was enacted to balance this dam building with the preservation of the free-flowing character and outstanding features of some of the nation's most beloved rivers. As of 2018, there are 208 rivers in the National System encompassing 12,700 miles (this is less than one-quarter of 1% of our nation's rivers). This includes nine designated rivers in New England.

With the exception of the Allagash River in Maine and the Wildcat in New Hampshire, all of the designated Wild and Scenic Rivers in New England are called Partnership Wild and Scenic Rivers. Partnership Rivers are a subset of the National System that flow through land predominantly held in private ownership or by state and local government (rather than through federal lands), and are characterized by strong partnerships among the adjacent communities and the National Park Service. Partnership Wild and Scenic Rivers have a stewardship approach that sets them apart from the other rivers comprising the National System.

Common principles of Partnership Rivers include:

- Administration is through post-designation Stewardship Councils comprised of local representatives (much like the Study Committee).
- Land use is governed by existing local municipalities and state laws and regulations.
- The National Park Service will not own or manage lands associated with the designation (other federal agencies such as US Fish and Wildlife Service—Oxbow National Wildlife Refuge—are unaffected).
- The National Park Service is responsible for implementing Section 7 of the Wild and Scenic Rivers Act to ensure federal consistency in preserving identified Outstandingly Remarkable Resource Values (ORRV) and the free-flowing character of the river. This responsibility is coordinated with each river's Stewardship Council.
- River stewardship plans are locally developed and approved prior to federal designation.
- River stewardship plans form the basis of the designation and guide subsequent voluntary actions.
- Stewardship responsibilities are shared among local, state, federal, and non-profit partners.
- Voluntary participation is essential to the partnership and viewed as the key to success.
- Partnership Wild and Scenic Rivers are not considered units of the National Park System, and are not subject to regulations that govern Park units.

## **Nashua River Study covering the Nashua, Squannacook, and Nissitissit Rivers**

The Nashua River Wild and Scenic River Study was initiated following passage of a bill introduced by the US Representative Niki Tsongas, at the request of local advocates with the support of municipalities. The bill was signed into law by President Barack Obama on December 19, 2014 (Public Law 113–291); it authorized a Study of the Nashua River, Squannacook River, and Nissitissit River.

The locally appointed Study Committee was convened in 2015 to investigate the eligibility and suitability of the inclusion of the Nashua, Squannacook, and Nissitissit Rivers into the National Wild and Scenic River System. The Study Committee was comprised of voting representatives

appointed by each of the participating riverfront municipalities—Ayer, Bolton, Dunstable, Groton, Harvard, Lancaster, Pepperell, Shirley, and Townsend in Massachusetts and Brookline and Hollis in New Hampshire—as well as the Nashua River Watershed Association and the National Park Service. Representatives from US Fish and Wildlife Service, US Geological Survey, Massachusetts Department of Fish and Wildlife, Massachusetts Division of Ecological Restoration, and Devens Enterprise Commission also participate in the Study Committee.

The role of the Study Committee was to determine whether the Nashua, Squannacook, and Nissitissit Rivers are eligible for federal designation, to assess the level of local support for such designation, and to summarize the Committee’s findings and recommendations in this voluntary Stewardship Plan. The Study Committee received financial and technical support from the National Park Service for the Study process.

The segments being recommended for designation include:

- The Nashua River at the confluence of the North and South Nashua Rivers in Lancaster, Massachusetts up to the New Hampshire state line.
- The Squannacook River at its confluence with the Nashua River in Groton up to its headwaters in Townsend, Massachusetts.
- The Nissitissit River at its confluence with the Nashua River in Pepperell up to its headwaters in Brookline, New Hampshire.

Three working dams in the Massachusetts portions of the Nashua and Squannacook Rivers—the Ice House Dam in Harvard, the Hollingsworth & Vose Dam in Groton, and the Pepperell Dam in Pepperell—will be “grandfathered” as existing facilities compatible with the designation. Designation will not impact their existing operations.

## **Outstandingly Remarkable Resource Values**

To be eligible for Wild and Scenic designation, a river must be free flowing (without dams) and possess at least one “outstandingly remarkable” natural, cultural or recreational resource value (deemed ORRVs in this Plan). An ORRV is a unique, rare, or exemplary river-related feature that is significant at a comparative regional or national scale. The Study Committee gathered information about the Nashua, Squannacook, and Nissitissit Rivers and their associated natural,

cultural, and recreational resources with assistance from knowledgeable community members as well as from local, state, and federal officials.

The Study Committee determined through its investigation that the Nashua, Squannacook, and Nissitissit Rivers possess numerous ORRVs in three main categories: Biological Diversity, Recreational and Scenic, and Historic and Cultural categories. Just a few highlights are listed below:

- The Study area has exceptional biological diversity, three state-designated Areas of Environmental Concern, six “Priority Natural Communities” along the Nashua River, and significant areas designated as “core habitat” by Massachusetts. Our findings include more than two dozen threatened, endangered, or species of special concern, including dragonflies in the Squannacook River; freshwater mussels in the Nissitissit River; and, additionally, a notably large population of Blanding’s turtles, which are state-listed in Massachusetts and New Hampshire.
- The cool waters of the Squannacook and Nissitissit Rivers provide some of the best fly-fishing within reach of Boston, Nashua, and Worcester. Some 30 bass fishing clubs hold tournaments on the Nashua River, more than 8,000 visitors annually use canoes or kayaks to recreate on the rivers, the 11-mile Nashua River Rail Trail runs alongside the river, and there are many miles of connected trails. Peaceful and scenic views are afforded from the river due to the extent of forested shoreline.
- The Study area has given rise to many influential conservationists, including Benton MacKaye and William Wharton. The area experienced a breathtaking resurgence of conservation activities in the 1960s that had lasting impact on the cultural fabric of the region. The “Marion Stoddart Story” and the clean up of the Nashua River has merited international acclaim and has been a model for watershed groups across the country. Noteworthy historic sites, including those associated with Native Americans, Shakers, and transcendentalists abound in our area.

## **Existing Protections**

For each ORRV identified, the Study Committee considered the protections existing for these resources and evaluated whether the protections are sufficient. The Committee then made suggestions for voluntary stewardship recommendations, which are included in this Plan.

Existing laws, regulations and ordinances at the federal, state, and local levels afford a high degree of protection for many of the ORRVs found along the Nashua, Squannacook, and Nissitissit Rivers.

An extraordinary proportion of the land along the Nashua, Squannacook, and Nissitissit Rivers is permanently protected by a mosaic of federal, state, and local entities. The result is increased biodiversity, increased scenic value, and increased recreational pleasure associated with our rivers.

## **Stewardship Recommendations**

This Stewardship Plan presents a series of recommendations that can be voluntarily implemented by local landowners, municipalities, and state and federal agencies working together to help protect river-related resources and maintain and enhance the quality and way of life valued by so many people. The recommendations in this locally developed Stewardship Plan can be implemented by a post-designation, locally appointed Stewardship Council working with communities and partners on a voluntary basis.

## **Next Steps**

The Study Committee is engaging with the riverfront communities in a dialogue about the Plan, its recommendations, and potential Wild and Scenic designation. This dialogue will culminate in the spring of 2018 with Town Meeting votes in eleven participating towns on the Stewardship Plan and Wild and Scenic River designation. The Study Committee and the National Park Service will only recommend designation if the Plan and designation are supported by favorable community votes in the participating towns.

## **Effects of Designation and Implementing the Plan**

Designation will result in establishment of a Stewardship Council comprised of representatives appointed by the eleven participating municipalities plus the Nashua River Watershed Association and the National Park Service. The Stewardship Council will guide the administration of the designation and implementation of the locally developed Stewardship Plan. Designation will also likely result in an appropriation of federal funds (subject to Congressional approval) to support implementation of the Stewardship Plan.

Existing state and local laws will continue to govern—private lands and activities will not be subject to increased federal control. Land use decisions will continue to be made by local planning and zoning boards, not federal agencies. The federal government will not acquire lands to implement the designation. Licensed, pre-existing hydroelectric facilities can continue to operate; other existing dams can be retrofitted for non-hydroelectric power purposes. Hunting and fishing laws and regulations will be unaffected, and rules governing agricultural practices will not change. If the rivers are designated, the designation would also give the local municipalities a voice, through the Stewardship Council and the National Park Service, in protecting ORRVs from any harmful effects of new *federally* funded or permitted construction or development of water resource projects affecting the designated portions of the rivers.

## In Conclusion

Working together, participating local, state, and federal partners can steward the outstandingly remarkable resources of the Nashua, Squannacook, and Nissitissit Rivers through voluntary actions.

# CHAPTER 1: WILD AND SCENIC RIVERS

## The National Wild and Scenic Rivers System

**When was this Established and Why?** The National Wild and Scenic Rivers System was established by the US Congress on October 2, 1968 with the passage of the Wild and Scenic Rivers Act (Public Law 90-542; 16 U.S.C. 1271) to protect free-flowing, outstanding rivers from the harmful effects of *new* federally assisted projects such as dams and hydroelectric facilities. The Act states:

It is hereby declared to be the policy of the United States that certain selected rivers of the Nation which, with their immediate environments, possess outstandingly remarkable scenic, recreational, geologic, fish and wildlife, historic, cultural, or other similar values, shall be preserved in free-flowing condition, and that they and their immediate environments shall be protected for the benefit and enjoyment of present and future generations. The Congress declares that the established national policy of dam and other construction at appropriate sections of the rivers of the United States needs to be complemented by a policy that would preserve other selected rivers or sections thereof in their free-flowing condition to protect the water quality of such rivers and to fulfill other vital national conservation purposes.<sup>2</sup>

**What Rivers are Eligible?** To be eligible for designation as “Wild and Scenic,” a river or river segment must have at least one Outstandingly Remarkable Resource Value (ORRV). The ORRVs are river-related scenic, recreational, geologic, fish and wildlife, historic, cultural, or other similar values. The locally identified ORRVs must have unique, rare, or exemplary qualities at a comparative regional or national scale. The ORRVs identified during this Study process are extensively discussed in Chapter 4.

To be eligible for designation, a river or river segment must also be free flowing. The term “free-flowing” refers to flow within the designated river segment and is not the same as naturally flowing. The free-flowing status of our rivers was evaluated during this Study process and is extensively discussed [on pages xx](#).

**Are There Special Protections?** Designation provides communities with special federal protection of the river. Section 7(a) of the Wild and Scenic Rivers Act describes the specific protections provided to designated rivers:

---

<sup>2</sup> Wild and Scenic Rivers Act of 1968, Public Law 90-542, 16 U.S.C. 1271 (1968).

The Federal Power Commission [Federal Regulatory Commission] shall not license the construction of any dam, water conduit, reservoir, powerhouse, transmission line, or other project works under the Federal Power Act . . . on or directly affecting any river which is designated . . . and no department or agency of the United States shall assist by any loan, grant, license, or otherwise in the construction of any water resources project that would have a direct and adverse effect on the values for which such river was established . . . No department or agency of the United States shall recommend authorization of any water resources project that would have a direct or adverse effect on the values for which such river was established . . .<sup>3</sup>

The intention of Section 7 of the Wild and Scenic Rivers Act is to protect the designated rivers from **new** federal projects that would adversely affect the free-flowing character or Outstandingly Remarkable Resource Values for which the rivers are designated. Section 7 requires the evaluation of partially or fully federally funded or permitted construction and development water resources projects within the designated area. This Section prevents licensing or exemption by the Federal Energy Regulatory Commission (FERC) of new dams or hydropower facilities on or directly affecting the designated area; prevents federal projects which have a direct or adverse effect on the free-flowing character, Outstandingly Remarkable Resource Values, or water quality of the designated area; and limits federal projects that would invade the designated area or unreasonably diminish the free-flowing character, Outstandingly Remarkable Resource Values, or water quality of the designated area.

Although this section is the regulatory arm of the Act, it applies only to specific federal projects and does not impact local zoning or the land use of private landowners, as this remains governed by local and state laws regardless of designation.

**How Many Rivers Have Been Designated?** As of 2018, fifty years after the passage of the Act, there are 208 rivers in the National Wild and Scenic Rivers System encompassing 12,700 miles. While this at first may seem like many miles, it is less than one-quarter of 1% of our nation's rivers. In Massachusetts, there are 8,229 miles of rivers, of which only 147.1 are designated as Wild and Scenic. Of New Hampshire's 10,874 miles of rivers, only 38 miles are currently designated Wild and Scenic.

There are nine designated rivers in New England: Allagash (Maine); Lamprey (New Hampshire); Wildcat Brook (New Hampshire); Concord, Sudbury, and Assabet Rivers

---

<sup>3</sup> Ibid.

(Massachusetts); Taunton (Massachusetts); Upper Missisquoi and Trout Rivers (Vermont); Westfield (Massachusetts); Eightmile (Connecticut); and Farmington (Connecticut).

## **Partnership Wild and Scenic Rivers**

**What Are Partnership Wild and Scenic Rivers?** Partnership Rivers are a subset of the National System that flow through land predominantly held in private ownership or by state and local government. Seven of the nine designated Wild and Scenic Rivers in New England are Partnership Wild and Scenic Rivers. They are managed through partnerships among the adjacent communities and the National Park Service.

Partnership Wild and Scenic Rivers have a management approach that sets them apart from the other rivers comprising the National System. The common principles of the Partnership Wild and Scenic Rivers include:

- No federal ownership or management of lands (federal ownership is excluded by Congress).
- Administration is through post-designation Stewardship Councils comprised of local representatives (much like the Study Committee).
- Adjacent land use continues to be governed by existing local municipalities and state laws and regulations.
- The National Park Service is responsible for implementing Section 7 of the Wild and Scenic Rivers Act to ensure federal consistency in preserving identified ORRVs and the free-flowing character of the river. This responsibility is coordinated with each river's Stewardship Council.
- River stewardship plans are locally developed and approved prior to federal designation.
- River stewardship plans form the basis of the designation and guide subsequent stewardship actions.
- Stewardship responsibilities are shared among local, state, federal, and nonprofit partners.
- Voluntary participation is essential to the partnership and viewed as the key to success.

The Nashua, Squannacook, and Nissitissit Rivers are being considered for possible designation as **Partnership** Wild and Scenic Rivers, a subset of the National Wild and Scenic Rivers system.

## Benefits of a Wild and Scenic River Designation

There are many benefits to a Wild and Scenic River Designation. Below are just a few:

- Preservation of a clean and plentiful water supply.
- Supports robust and diverse plant and animal populations that reflect a healthy ecosystem.
- Improved passage for safe boating on the rivers and other recreational enhancements.
- Preservation of scenic views that define our local communities.
- Fostering the next generation of conservationists.
- Recognition of important cultural and historical sites.
- Possible funding support to help towns achieve priority projects to help steward the outstandingly remarkable resource values.
- Small grants to help local schools, towns, civic groups, private landowners and others on projects that support the purposes and goals the Stewardship Plan.

## CHAPTER 2: “NASHUA RIVER WILD AND SCENIC RIVER STUDY” covering the Nashua, Squannacook, and Nissitissit Rivers

### Wild and Scenic Study Authorization

**First Steps.** To determine if a particular river or river segment is eligible for inclusion in the National Wild and Scenic Rivers system, a Wild and Scenic River Study is conducted. In 2009, the Nashua River Watershed Association (NRWA) began assessing whether any of the rivers in the Nashua River watershed might merit such a formal Wild and Scenic River Study process.

The NRWA found that much of the Nashua River was already included in the 1982 Nationwide Rivers Inventory of candidates for Wild and Scenic designation.

The NRWA looked at the Nashua River’s main tributaries in light of the Wild and Scenic criteria and assessed that the Squannacook and Nissitissit Rivers could almost assuredly also merit designation. On the other hand, the North Nashua River did not seem to be a strong candidate for inclusion at that time, as its 20 miles had 11 dams and its water quality was still compromised by unresolved Combined Sewer Overflow situations in the cities of Leominster and Fitchburg. The NRWA, in consultation with the National Park Service, concluded that for a first time venture in the Nashua River watershed regarding seeking Wild and Scenic designation, it would be appropriate to seek authorization for a Study to be conducted on only sections of the Nashua, Squannacook, and Nissitissit Rivers.

It was noted at the time that there was precedent for the future Stewardship Councils of designated rivers to undertake successive ventures to seek designation for additional meritorious rivers in their watersheds.

**Initial Support.** In 2009, the NRWA began outreach to the Boards of Selectmen of the Nashua, Squannacook, and Nissitissit’s riverfront towns, seeking their support for asking Congress to authorize a formal Study of sections of the rivers for potential inclusion as Partnership Rivers in the National Wild and Scenic Rivers System. Assured of broad local support for the study, US Representative Niki Tsongas first introduced legislation to Congress in 2011, and, as is typical, the legislative process took several years.

**NPS Reconnaissance Survey.** In 2013, at the request of Representative Tsongas, the Northeast Region of the National Park Service (NPS) conducted a reconnaissance survey<sup>4</sup> of the Nashua, Squannacook, and Nissitissit Rivers to evaluate them as candidates for potential Wild and Scenic River designation and as a step toward a full Wild and Scenic River Study. The preliminary findings were that eligibility and suitability criteria were likely to be met, and that a Wild and Scenic River Study would be appropriate and productive.

**Legislation Authorizing the Study.** On December 19, 2014, a bill re-introduced to Congress by Representative Tsongas was signed into law by President Barack Obama,<sup>5</sup> authorizing the “Nashua River Wild and Scenic River Study” encompassing the Nashua, Squannacook, and Nissitissit Rivers. A public announcement and celebration was held on January 12, 2015 at the Nashua River Watershed Association’s River Resource Center in Groton, Massachusetts.

The resultant Study was conducted according to the principles associated with the Partnership River Study approach, as described below.

## **The Study Committee**

**Committee Membership.** After the Study was authorized, the National Park Service entered into a Cooperative Agreement with the Nashua River Watershed Association and provided financial<sup>6</sup> and technical support. The NRWA convened a Study Committee, which held its first meeting in October of 2015 after funding was in place and representatives were appointed. The backbone of the Study Committee consists of formally appointed representatives from each of the eleven towns ultimately participating in the Study: Ayer, Bolton, Dunstable, Groton, Harvard, Lancaster, Pepperell, Shirley, and Townsend in Massachusetts; Brookline and Hollis in New Hampshire. Each municipality has a vote on the Committee, as does the Nashua River Watershed Association and the National Park Service. Representatives from US Fish and Wildlife Service, US Geological Survey, Massachusetts Department of Fish and Wildlife,

---

<sup>4</sup> National Park Service Northeast Region, *Wild and Scenic River Reconnaissance Survey of the Nashua River* (Department of the Interior, National Park Service, Northeast Region, Boston, Massachusetts, 2013).

<sup>5</sup> Carl Levin and Howard P. “Buck” McKeon National Defense Authorization Act for Fiscal Year 2015, Public Law 113-291, H.R. 3979 (2014).

<sup>6</sup> While the National Park Service has provided the vast majority of funding, additional support was provided through a grant from the Bruce J. Anderson Foundation to the NRWA and a small portion of a grant from Bristol-Myers Squibb Company. Additional *pro bono* services contributed substantially to the work of the Study Committee.

Massachusetts Division of Ecological Restoration, and Devens Enterprise Commission also participate in the Study Committee. Additional stakeholders with resource expertise regularly participate in the Committee as well, providing invaluable assistance.

The full Study Committee has been meeting regularly on the third Thursday of each month, with all meetings open to the public. Notes of the meetings are posted on the Committee's website: [www.wildandscenicnashuarivers.org](http://www.wildandscenicnashuarivers.org) along with a wealth of related information. Two subcommittees were formed, the Outstandingly Remarkable Resource Value Subcommittee and the Outreach Subcommittee. Throughout the process, the knowledge of numerous federal, state, and local experts were drawn on and extensive public input was sought.

**Responsibilities of the Study Committee.** Consistent with the approach taken in exploring all Partnership rivers, over the course of the approximate three-year study process, the Study Committee's main responsibilities have been to:

- Determine whether the Nashua, Squannacook, and Nissitissit Rivers are eligible for inclusion in the Wild and Scenic Rivers System, assess the rivers' free-flowing characters, document ORRVs, and determine the specific sections for which to seek designation.
- Serve as the focal point for local community, citizen, and stakeholder involvement throughout the study process; determine whether there is suitable local support and commitment for designation.
- Review local, state, and federal protections that are already in place for the ORRVs: assess current threats to the ORRVs, and identify opportunities for stewardship.
- Develop a locally driven Stewardship Plan to serve as a blueprint for improved stewardship of the identified natural, recreational and scenic, and cultural and historic values, with technical assistance from the National Park Service; the recommended actions can be undertaken voluntarily in the future, regardless of whether designation occurs.

**NPS Study Report to Congress.** Upon fulfillment of the main Study Committee responsibilities outlined above, the National Park Service summarizes the research and findings in a NPS Study Report to Congress. The finalized Study Report is a separate

document from this Stewardship Plan and is presented to Congress. The presentation of the NPS Study Report to Congress, anticipated to be in June or July of 2018, is followed by a public comment period. Designation requires that a bill be passed by Congress and signed by the President.

## **Summary of Findings**

**Sections & Boundaries.** The sections being recommended by the Study Committee for designation include:

- The Nashua River at the confluence of the North and South Nashua Rivers in Lancaster, Massachusetts up to the New Hampshire state line.
- The Squannacook River at its confluence with the Nashua River in Groton up to its headwaters in Townsend, Massachusetts.
- The Nissitissit River at its confluence with the Nashua River in Pepperell up to its headwaters in Brookline, New Hampshire.

The National Park Service is recommending that small sections be excluded from the designation upstream and downstream from the three working dams in Massachusetts—the Ice House Dam in Harvard, the Hollingsworth and Vose Dam in Townsend, and the Pepperell Dam in Pepperell.

The Wild and Scenic Rivers Act does not contain specific requirements regarding lateral boundaries or the minimum width of the river corridor after designation. Consistent with the established Partnership Wild and Scenic River model, which involves no federal land acquisition or management, there are no distinct lateral boundaries or corridors established within this Stewardship Plan or for the Partnership Wild and Scenic designation of sections of the Nashua, Squannacook, and Nissitissit Rivers.

The Stewardship Plan focuses its stewardship efforts on the rivers themselves, their tributaries and headwaters, and their immediate riparian corridors. Lands within the floodplain, immediately adjacent to the rivers' banks, or which are noteworthy in their scenic character receive the greatest attention. For uplands outside of this area—indeed throughout the entire watershed—the Plan identifies beneficial actions relating to water quality maintenance and improvement and other issues best addressed by taking a watershed approach.

**Requirement of Free-Flowing Character.** As noted above, the National Park Service is recommending that small sections be excluded from the designation upstream and downstream from the three working dams in Massachusetts. For a full discussion of dams, see Appendix A. Note that our dams are also associated with Outstandingly Remarkable Resource Values involving river-related cultural and historical sites, as included on pages xx, xx, and xx.

**Demonstration of Outstandingly Remarkable Resource Values (ORRVs).** The Study Committee—with assistance from many federal, local, regional, and state resource professionals—successfully identified and documented three categories of ORRVs: A. Biological Diversity; B. Recreational and Scenic; and C. Cultural and Historic. Understanding the “Rivers as Corridors” is discussed in Chapter 3. In Chapter 4, descriptions of each ORRV Category directly precede the recommended actions.

**Local Support and Commitment.** From start to finish, the active representation of the municipalities on the Study Committee served as one form of testament to local concurrence regarding the ORRVs and local support for the action plan to protect them. Throughout the process, presentations were given to Boards of Selectmen, Conservation Commissions, and Planning Boards in each of the towns, and outreach to Water Departments and Departments of Public Works was done if separate departments existed. Local Historical Commissions and Societies were contacted, as were fishing clubs, sportsmen clubs, local and regional land trusts, Greenway Committees, regional and local trails groups, Regional Planning Authorities, conservation organizations, and dam owners.

Broad public input was solicited at multiple Public Forums, through public service announcements (PSA), and numerous e-news and Facebook postings. Leading up to the Annual Town Meetings, extensive additional outreach is being done, including production and circulation of a short educational video. The endorsements from the town boards and the entities listed above will be printed in an Addendum to this Stewardship Plan and will appear in the National Park Service Report to Congress. Ultimately, affirmative votes at the spring 2018 Town Meetings will be the strongest expression of local support. See Chapter 5 regarding the upcoming Town Votes, and see **Appendix X** for highlights of outreach events, forums, and activities through February 15, 2018 as well as to see sample materials.

**Existing federal, state, and local protections.** A Regulatory Review was conducted by the Study Committee and reviewed extensively by local, regional, and state regulatory professionals. The Regulatory Review is presented in Chapter 6.

**Stewardship Plan Recommended Actions.** The Study Committee has no regulatory authority. Similarly, the future Stewardship Council that will evolve from the Study Committee after designation will have no regulatory authority. The locally driven Stewardship Plan offers recommendations for voluntary actions that could be taken to protect and enhance the ORRVs, whether or not designation occurs. These suggested actions can be found in detail in **Appendix X**.

### **In Conclusion: The Study Committee Recommends Designation.**

#### **Wild and Scenic River Designation**

The Nashua River Wild and Scenic River Study Committee believes that designation of segments of the Nashua, Squannacook and Nissitissit Rivers as components of the national Wild and Scenic Rivers system is a critical step in the fulfillment of the goals and resource objectives that have been defined for the rivers in this Plan. The designation would:

1. Officially recognize segments of the Nashua, Squannacook, and Nissitissit Rivers as a resource of national significance.
2. Establish the National Park Service as a partner in the implementation of this Plan.
3. Provide opportunity for federal funding to implement the action strategies of the Plan and support the operations of the proposed Nashua, Squannacook, and Nissitissit Rivers Stewardship Council.
4. Protect the designated river segments from potentially harmful federal water resource development projects, which could threaten the outstanding resource values of these rivers.

If sections of the Nashua, Squannacook, and Nissitissit Rivers are designated as part of the National Wild and Scenic Rivers System by the United States Congress, this Stewardship Plan would serve as the “Comprehensive Management Plan” required for all National Wild and Scenic Rivers.

The Nashua River Wild and Scenic River Study Committee voted to endorse this Stewardship Plan and to recommend designation at its [date to be filled in upon the vote] 2018 meeting.

## CHAPTER 3: THE RIVERS AS CORRIDORS

The region covered by our Stewardship Plan has a long and remarkable history of conservationists, beginning with Native Americans, who utilized the area as prime hunting grounds because of its extraordinary wildlife habitat and density of wildlife.<sup>7</sup> As stewards of this landscape, they kept the area virtually free of all permanent settlements in order not to despoil this special, productive area.

---

<sup>7</sup> "Native Americans and later settlers would have been attracted to this area for not only the well-drained soils and fresh water supply, but also the wildlife that would have inhabited the many local wetlands. Wetlands in particular offered an often overlooked variety of relatively predictable, abundant, and nutritional resources for humans and their hunted prey. Wetland plants include emergent wetland species such as cattail, water plantain, and arrowhead, deep water species such as water lily, and wet meadow plants such as nutsedge. Ground nut also grew abundantly along riverbanks in the region before the introduction of domesticated pigs by Europeans." Mitchell T Mulholland, "Community-Wide Archaeological Reconnaissance Survey of Groton, Massachusetts. Public Version" (Archaeological Services, Department of Anthropology, University of Massachusetts, Amherst, Massachusetts, March 2011), page 30, [www.townofgroton.org/DesktopModules/Bring2mind/DMX/Download.aspx?PortalId=0&EntryId=14113](http://www.townofgroton.org/DesktopModules/Bring2mind/DMX/Download.aspx?PortalId=0&EntryId=14113))

More recently, the area has produced a long list of notable conservationists and conservation entities. Benton MacKaye (1879–1975) is one of several luminaries whose views were shaped by our study area; he in turn “significantly influenced the evolving American conservation and environmental movements.”<sup>8</sup> MacKaye is well known as the visionary inspiration behind and proponent of the Appalachian Trail and a co-founder of the Wilderness Society. His home terrain in Shirley Center provided the model and the muse for many of his ideas about forestry, recreational trails, regional planning, conservation, transportation, wilderness preservation, and habitable and sustainable communities.<sup>9</sup> MacKaye helped pioneer the idea of land preservation for recreation and conservation purposes, and was a strong advocate of balancing human needs and those of nature.

Possible call-out box: Benton MacKaye, environmental pioneer with roots in the Nashua River area, advocated for land preservation and linear greenbelts while serving to inspire the Appalachian Trail and the Wilderness Society.

Nearly one hundred years ago, MacKaye urged Massachusetts's state officials and conservationists to develop a linear park along the full length of the Squannacook River<sup>10</sup> and Willard Brook, one of the Squannacook's main tributaries. He proposed a south-north recreational greenbelt that he called a "Wachusett/Watatic Wilderness Way." As a consultant for the 1929 Governor's Committee on the Needs and Uses of Open Spaces, he promoted a statewide network of such wilderness ways that would serve "to control the flow of metropolitan civilization."

A most important element of MacKaye's ideas and visions that are well worth heeding today, is the notion of using corridors following natural features, such as linear mountain ranges and rivers, ...for controlling and limiting growth, while providing recreational opportunities and protecting natural resources. Greenways, the conversion of abandoned railroad beds to trails, urban growth boundaries, the activities of local land trusts, and, of course, the creation of heritage areas exemplify today's approach to “linking up” separate corridor projects into larger

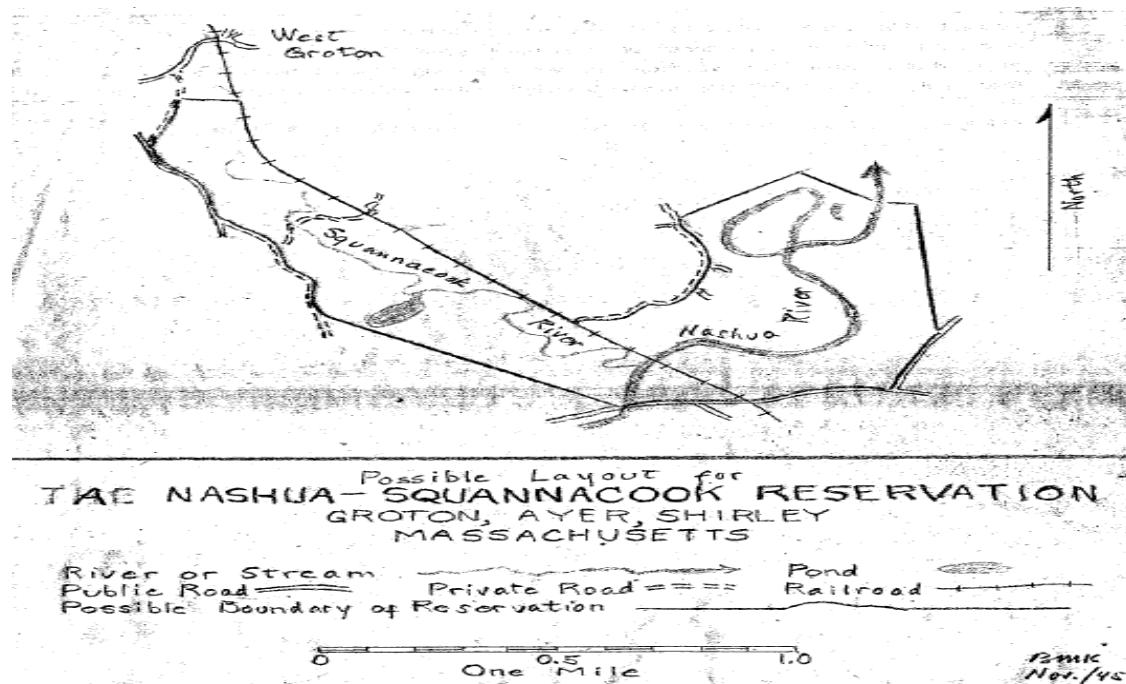

---

<sup>8</sup> Larry Anderson, *Benton MacKaye: Conservationist, Planner, and Creator of the Appalachian Trail* (Johns Hopkins University Press, November 12, 2002), page 1.

<sup>9</sup> Benton MacKaye was also the first graduate of Harvard University's School of Forestry in Petersham, Massachusetts, as well as an incorporator of the Nashua River Watershed Association, along with Marion Stoddart, in 1969.

<sup>10</sup> The 1952 *Conservation Land Use Plan for the Town of Groton Massachusetts* recommends “...acquiring land for a Squannacook River Park,” pages 9-10.

regional networks. In combination these river corridors form not just a key habitat network but more importantly provide for landscape-level ecosystem requirements.<sup>11</sup>

*Figure 1: “Possible Layout for a Nashua-Squannacook Reservation,” hand-drawn map by Benton MacKaye<sup>12</sup>*

The Nashua, Squannacook, and Nissitissit Rivers are ecological and biological corridors; animals use them as habitat and for passage. The Massachusetts Audubon Society, in a report entitled “Focus Areas for Wildlife Habitat Protection in the Nashua River Watershed,” points out that the river valleys serve as both wildlife habitat corridors and natural south-north migration routes for terrestrial and aquatic fauna and flora set within a context of contiguous undeveloped and, in many cases, permanently protected land.<sup>13</sup>

Efforts to protect major tracts of riparian land have already met with significant success in the region covered by our Stewardship Plan. The various conservation lands in our study area are

crucial stepping-stones for wildlife movement north from the anchor that is the Oxbow National Wildlife Refuge (ONWR).<sup>14</sup>

The “Oxbow/Intervale/Bolton Flats” area is also cited in a report, *Focus Areas for Wildlife Habitat Protection in the Nashua River Watershed*, as a large wildlife habitat focus area of ~8,500 acres. These areas with large amounts of little-disturbed interior are “cornerstones of a habitat reserve design for the Nashua River Watershed.” “Tracks of bobcat, black bear and moose have been recorded within this focus area. Bobcats are particularly sensitive to human disturbance and their presence in an area is a very strong indicator of high quality habitat.”<sup>15</sup>

---

<sup>14</sup> For example, the ONWR beneath the Route 2 Bridge over the Nashua River is one of the few locations for wildlife to cross the barrier created by that heavily trafficked highway.

<sup>15</sup> Harvard Open Space and Recreation Plan, 2017, page 35.

*Map 1 Open Space Lands Map – Nashua River Watershed Association 2017*

In addition to the Oxbow National Wildlife Refuge—which alone protects eight miles along the Nashua River—the Nashua, Squannacook, and Nissitissit River corridors provide linear linkages among several other sizeable public conservation lands in the region covered by our

Stewardship Plan. Noteworthy examples are the Ayer State Game Area, Bolton Flats Wildlife Management Area (WMA), Groton Town Forest, J. Harry Rich State Forest, Sabine Woods, Squannacook and Nissitissit River WMAs, Surrenden Farm, and Townsend State Forest.

Much of the remaining unprotected riparian land enjoys partial protection under the 1996 Massachusetts Rivers Protection Act and under local floodplain zoning bylaws.

A draft GIS analysis of the ¼ mile corridor of the three rivers (in Massachusetts only) shows a total of approximately 16,825 acres of floodplains of which approximately 15,715 acres is permanently protected; that is, more than 93% of all floodplains are protected and only less than 7% (~1,100 acres) is unprotected to date.<sup>16</sup>

The focus of the very first Nashua River Watershed Association “Greenway Committees” (circa 1969) was to encourage each town to have a greenway committee and “floodplain protection” zoning bylaws. Lancaster was the first town to have such a greenway committee. The largely protected corridors of the Nashua, Squannacook, and Nissitissit Rivers continue into New Hampshire through holdings of the Brookline Conservation Commission, Nissitissit River Land Trust, and Beaver Brook Association (~2,200 acres) in Hollis<sup>17</sup> and Brookline, New Hampshire. As far back as 1963, the New Hampshire Natural Preserves Forum wrote, “An attempt should be made to protect this [Nissitissit] River in a joint project with Massachusetts. On a small scale, this would be comparable to some of the ‘Wild River’ projects of the national government.”<sup>18</sup>

Hollis, New Hampshire is fortunate to contain what is probably the largest concentration of conservation land in the south central New Hampshire region. Extensive conservation holdings are located throughout the town. This category includes private conservation lands held by

---

16 Nissitissit River (in MA only): ~3,200 acres floodplain total in corridor with ~3,135 acres protected and ~65 acres unprotected (98% protected or 2% unprotected)

Squannacook River: ~4,800 acres floodplain corridor total in corridor with ~4,570 acres protected and ~230 acres unprotected (95% protected or 4.75% unprotected)

Nashua River (mainstem in MA only): ~ 8,825 acres floodplain corridor total in corridor with ~8,010 acres protected and ~815 acres unprotected (91% protected or 9% unprotected)

17 Beaver Brook, a significant tributary to the Nissitissit River, flows through Beaver Brook Association’s lands and has its confluence with the Nissitissit River at the Hollis, New Hampshire and Pepperell, Massachusetts state line.

18 New Hampshire Natural Preserves Forum, 1963.

Beaver Brook Association, the Nissitissit River Land Trust, homeowner's associations, and other groups as well as the town. Beaver Brook Association owns the largest concentration of land in Hollis with 1,643 acres (out of a total of ~2,200 acres). The Nissitissit River Land Trust owns 65 acres, forming a protective corridor along the Nissitissit River. The town owns most of the remaining conservation land. The acquisition of most of the conservation and recreation land in Hollis has resulted in the formation of a greenway system that connects natural areas.

A semi-circular pattern has emerged that stretches from the Nissitissit River in the town's southwestern extreme, northerly through the vast holdings of the Beaver Brook Association toward Silver Lake State Park and Spalding Park Town Forest north of Town Center. In recent years, the pattern has been recognized and efforts have been made to fill in the remaining gaps.

This pattern of extensive open spaces connected by riparian corridors creates a synergistically larger, unified entity from what would otherwise be fragmented areas.<sup>19</sup> In other words, maintaining the connectivity of ecologically and biologically diverse open spaces and habitats is important at the regional scale because connectivity gives the components of our shared landscape the resilience needed to survive challenges, such as warming weather patterns, better than isolated areas can. Additionally, the extensive riparian corridors of the Nashua, Squannacook, and Nissitissit Rivers are further, importantly extended by greenways along each of their tributaries.

In a 1992 survey, the US Fish and Wildlife Service stated "...the value of large, contiguous undeveloped areas for species long term protection outweighs exponentially that of an equal area of *disjunct refugia* spread among suburban environs."<sup>20</sup> The quantity of rare species found in our area confirms this.

The science of landscape ecology tells us that where lands are still interconnected, ecological processes are more likely to persist in a continuous system to provide dispersal corridors, which protect local populations from chance extinction events, and provide opportunities for regional recolonization and genetic flow to outside populations. Here in New England, that is

---

19 R.J. Naiman, "The Role of Riparian Corridors in Maintaining Regional Biodiversity," (*Ecological Applications* Vol. 3, No. 2, May 1993).

20 US Fish and Wildlife Service, "Survey and Evaluation of Wetlands and Wildlife Habitat," (Fort Devens Massachusetts, 1992, page 71).

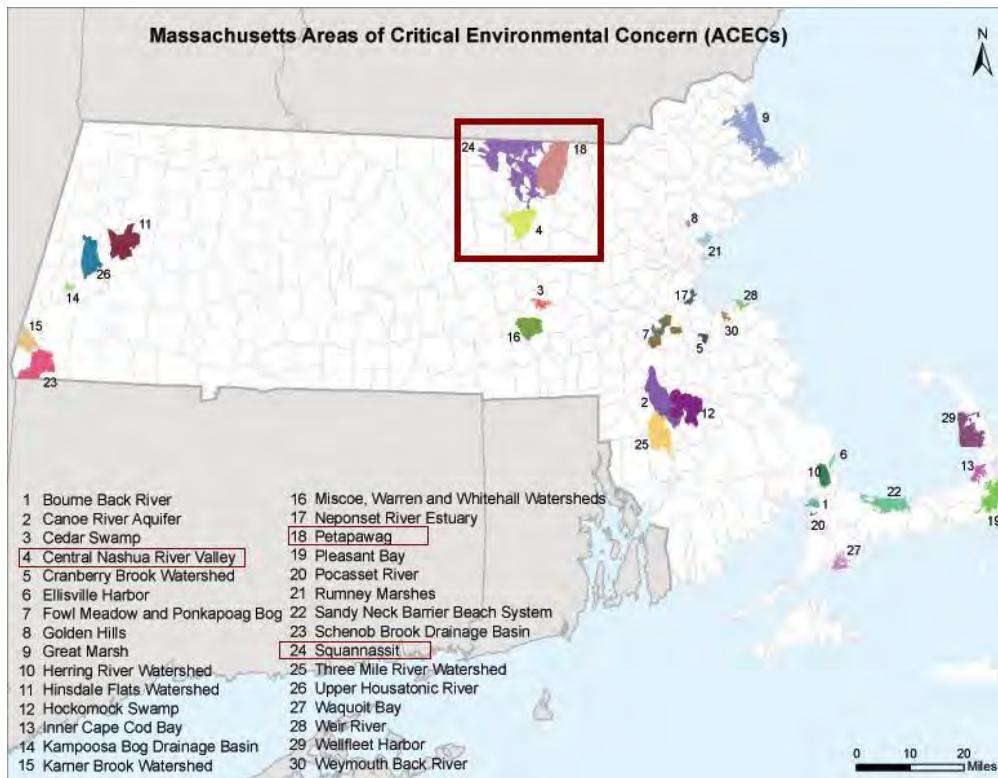

primarily from the south to the north.<sup>21</sup> The region covered by our Stewardship Plan has high ecological integrity and is a resource-rich unit that has been recognized by State of Massachusetts as three unique Areas of Critical Environmental Concern (ACEC): the Central Nashua River Valley, the Squannassit, and the Petapawag ACECs. These three contiguous ACECs together comprise 76,000 acres or 118 square miles—a full 28% of the total existing ACEC's throughout Massachusetts.<sup>22</sup>

The connectivity of the three ACECs via the Nashua River provides significant linkages between important wildlife areas. Indeed, when one includes MassWildlife's Bolton Flats Wildlife Management Area, the amount of open space along the Nashua River creates what could be the largest, least human-impacted habitat in the entire 530+ square mile Nashua River watershed.

---

21 South to north corridors in New England are particularly important in a time of warming weather patterns as species must evolve their ranges northward; see <https://climateactiontool.org>.

22 ACECs are a formal designation made by the Massachusetts Secretary of Energy and Environmental Affairs to protect and preserve areas of environmental significance. [There is no comparable New Hampshire program.] The designation notifies regulatory agencies and the public that most development activities under State jurisdiction within ACECs must meet high environmental quality standards. The fundamental reason for these designations is the need to protect both open spaces and the interconnections that are essential to maintaining the biological diversity of the entire region.

Efforts to protect our key resources go back many decades. Prepared by the Nashua River Watershed Association, the first *Regional Plan for the Nashua River Greenway* called for “protecting the watershed; providing habitat for wildlife; conserving the ecology; preventing future river pollution; providing open space and outdoor recreation opportunities; maintaining high water quality; increasing property values; enhancing the general economy; and providing a population buffer zone.”<sup>23</sup>

Benton MacKaye was not the only influential conservationist with roots in our area who recognized the importance of river corridors. William P. Wharton (1880–1976) of Groton, Massachusetts, a contemporary and friend of Benton MacKaye, was an incorporator of both the Nashua River Watershed Association and the New England Forestry Foundation, as well as a President of the National Parks Association. Wharton was an advocate of numerous local as well as national conservation projects. He, along with his friend Harris Reynolds, is also credited with introducing the idea of the Town Forest into the United States.<sup>24</sup>

23 Nashua River Watershed Association, “Regional Plan for the Nashua River Greenway,” (1970)

24 Massachusetts Forest and Park (Association) News, (August 1970, page 98)

Ellen Swallow Richards of Dunstable is another important conservationist; she is credited with establishing the field of ecology in the 1890s. The area was also the home of the Lowthorpe School, the second school of Landscape Architecture in the United States, where numerous leading landscape architects studied. Noted landscape architect and Harvard professor Charles Eliot II was a patron of the school. In 1963, Eliot also wrote Groton's first Master Plan as well as Harvard's in 1969, both of which introduced advanced concepts of environmental protection and planning.

In 1923, Jeffrey P. Smith (1902–1987) inherited the neglected “Buttonwood Farm” in Hollis, New Hampshire and devoted the next 40 years to dairy farming. After retiring, he began championing limited growth and conservation, having become troubled about rapid population growth in Hollis and surrounding communities. Smith’s cousin, Hollis Nichols, joined with him in acting on their shared interest: acquiring land for conservation. Beginning with Hollis’s own estate, in 1964 Smith and Nichols organized Beaver Brook Association to protect local land from development.<sup>25</sup> During the next decade and a half, with help from gifts of money, they were able to negotiate 86 different purchases totaling 1,500 acres, including Smith’s own 200 acres gifted to Beaver Brook Association. Today, Beaver Brook Association has more than 2,200 acres.

Jeffrey P. Smith also influenced the formation of other land trusts. He helped organize the Nissitissit River Land Trust founded in 1968,<sup>26</sup> which is dedicated to protecting all of the land along the Nissitissit River, much of which has now been protected. Smith additionally joined with three Pepperell residents to form the Nashoba Conservation Trust in 1969 and is the Smith of the eponymous Nichols-Smith Land Trust. The “Jeff Smith Trail”—eight miles over parcels of land in Hollis and Pepperell that are owned by organizations helped by Smith—was created to permanently honor Smith’s life-long efforts. Smith also helped establish the Hollis Conservation Commission, which in 1966 petitioned New Hampshire’s Governor Peterson to stop the pollution of the Nashua River. The Commission then contacted Massachusetts

---

25 1964 was also the year that the Town of Hollis was the first in New Hampshire to form a municipal Conservation Commission.

26 “It so happened that in 1962 a group called the New England Wildflower Preservation Society conducted a field trip along those 9 miles [of the Nissitissit River]. The field trip led the New Hampshire Natural Preserves Forum to list the river as worthy of preservation.’ That in turn led to the formation of the Nissitissit River Land Trust, incorporated in 1968.” [www.brookline.nh.us/conservation-commission/pages/nissitissit](http://www.brookline.nh.us/conservation-commission/pages/nissitissit)

conservation commissions along the Nashua River to describe what Hollis had done and to ask them to do the same.

Marion Stoddart is recognized by many to be our area's most influential champion of the rivers and the river corridors. Moving to Groton in 1962, Stoddart was appalled by the befouled condition of the Nashua River. In 1965, she formed the Nashua River Clean-Up Committee and galvanized a grassroots movement to address the situation. The Clean-Up Committee evolved to become the Nashua River Watershed Association (NRWA), formalized in 1969 with Benton MacKaye, Lee P. "Bill" Farnsworth, Jeffrey P. Smith, Marion Stoddart, and William Wharton, among others, as incorporators.

From its outset, the NRWA took a collaborative watershed approach to protecting natural resources and highlighted the inextricable link between water quality and land use in all its initiatives. The NRWA's earliest plans called for the establishment of permanently protected greenway along the river and its major tributaries. Together with others, Stoddart has worked for five decades to fulfill this vision, and today over 50% of the Nashua, Squannacook, and Nissitissit Rivers is permanently protected. [Possible call-out box]

Today, the Nashua, Squannacook, and Nissitissit river corridors support outstandingly remarkable biological and ecological diversity. They also support outstandingly remarkable opportunities for recreation, for enjoyment of scenic views, and for appreciation of historical events that shaped our region. This Stewardship Plan for the Nashua, Squannacook, and Nissitissit Rivers, developed through a locally driven process, outlines voluntary actions that can be taken to maintain and enhance our outstandingly remarkable resource values.

## CHAPTER 4: OUTSTANDINGLY REMARKABLE RESOURCE VALUES

*Photo: Cindy Knox Photography*

To be included in the National Wild and Scenic Rivers System, a river must meet certain eligibility criteria, including possessing at least one "outstandingly remarkable" resource value (ORRV in this Plan). An ORRV must be natural, historical, cultural, recreational or scenic in character, be river-dependent, and have unique, rare, or exemplary qualities on a regional or national scale. The Nashua, Squannacook, and Nissitissit Rivers possess a great many such resources that meet these criteria. This chapter describes these resources, which include aspects of biological and ecological diversity, recreational and scenic values, and historic and cultural resources.

### The Shaping Forces: Geology, Aquifers, and Ecoregions

**Geography.** The Nashua River watershed includes parts of 32 communities in Massachusetts and New Hampshire, with a total drainage area of approximately 538 square miles. The Nashua River flows for a total of 56 miles before joining with the Merrimack River at Nashua, New Hampshire. The Nashua River and its tributaries have some highly unusual characteristics. The majority of the tributaries that feed the mainstem of the Nashua River flow in a southerly direction, while the mainstem flows in a northerly direction. The North Nashua River begins in the former industrial centers of Fitchburg and Leominster before flowing southeastwardly into Lancaster. The South Nashua River flows from the Wachusett Reservoir,

which serves as part of the water supply for Boston. The two main branches of the river join in Lancaster to form the mainstem, which then flows to its terminus in New Hampshire.

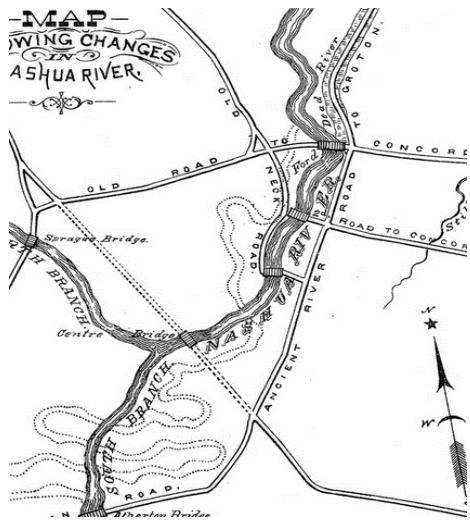

**Geology.** The bedrock underpinning our study area is made up of two types of rock: granite and other igneous types; and metamorphic, primarily schist and gneiss. Over ten thousand years ago, the Nashua River valley was carved by moving glacial ice that was over one mile thick. The Nashua River itself was once Glacial Lake Nashua, an enormous lake that extended from Boylston, Massachusetts north to Nashua, New Hampshire. At that time, the mainstem river flowed southward through the Worcester area.

Bedrock and a thin layer of glacial till “hardpan” dominate the higher elevations of the watershed, especially to the west and northwest, where the main tributaries to the mainstem Nashua River rise: the Squannacook and Nissitissit as well the North Nashua, Quinapoxet, and Stillwater Rivers. These relatively cooler (with the exception of the North Nashua River), higher-gradient rivers all flow from the northwest to the southeast and meet the Nashua River at sharp angles, turning to join the mainstem which flows in a northeasterly direction. The flow of the tributaries is additional evidence that the Nashua River used to flow south.<sup>27</sup> The river’s course was reversed as the edge of the last ice age glacier melted away, leaving Glacial Lake Nashua to drain to the north. There are many sand and gravel deposits dating from the glacial period in the central part of the valley. These porous deposits often have accessible groundwater used as municipal water supplies.

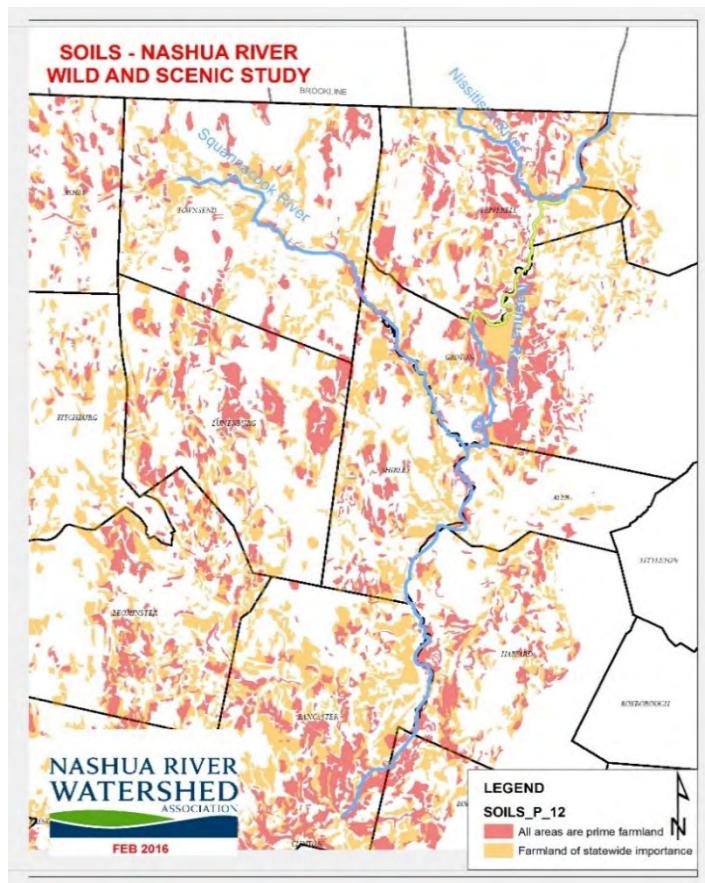

There is considerable landscape-level geomorphologic variation within our focus area, which is characterized by topography dominated by glacially shaped geological forms and river valleys underlain by aquifers. Not surprisingly, it has many glacial artifacts: kettlehole ponds with fluctuating water levels; spruce bogs, kame terraces, and eskers; and sandy outwash soils. Such soil acts as a recharge area in large floodplains, which support many types of rare flora. Not only is the area especially rich in diverse wetland habitats because of the meandering Nashua River, but there is also an unusual amount of field, floodplain grassland, and wet meadow habitat due to the river's oxbows and wide floodplains.

---

<sup>27</sup> Reference in the History of Lancaster, re: the shape of Pine Hill: Rev. Abijah P. Marvin, *History of the Town of Lancaster: From the First Settlement to the Present Time, 1643–1879*, (Lancaster : Published by the town, 1879)

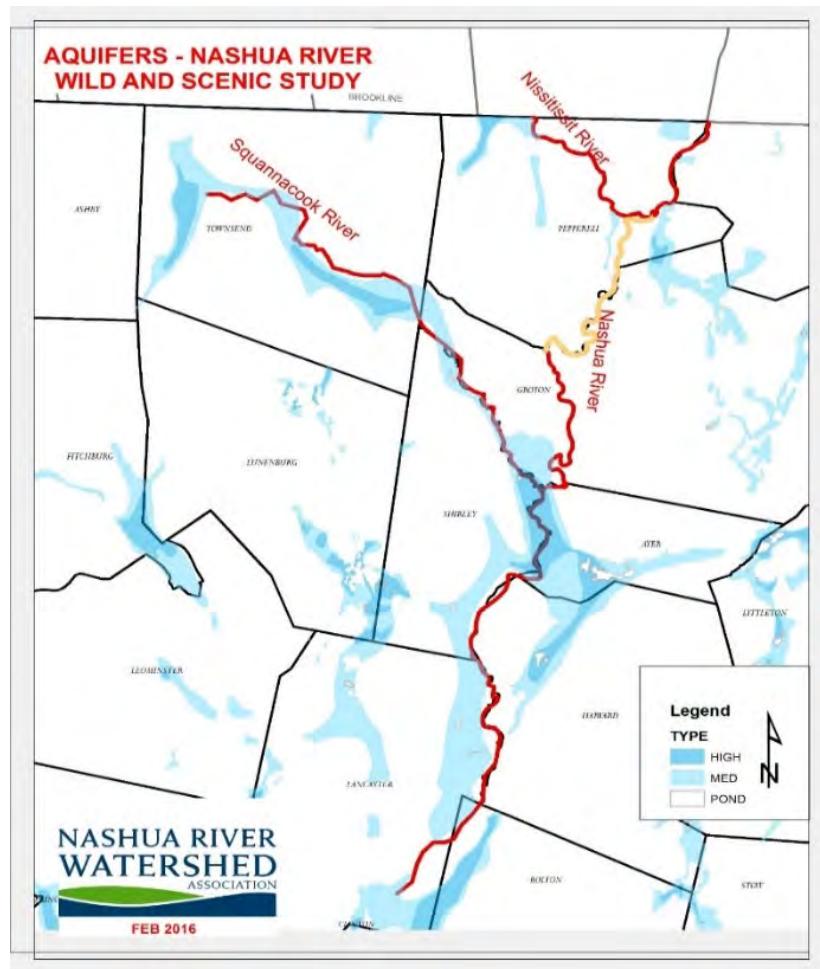

vers to the large curve in Neck Road. Farther north, at Lane's Crossing (where Harvard and Seven Bridge Roads cross), the traveler could take the Post Road westward Brattleborough, Vermont, or continue north up Harvard Road. This map also shows the Neck area (across the upper part of the Y made by the river lines above a long plateau of land sloping gently down to the river on both sides extends northward from the Meeting of the Waters to the southern base of Ponakin Hill (not shown on map). All of Lancaster Center is on the Neck.

*Figure 2: Images of America: Lancaster*

Note: There are other considerable “ecosystem service” benefits associated with wetlands and floodplain grasslands: because of their high rates of production they are second only to rainforests in removing carbon from the atmosphere, thereby moderating warming

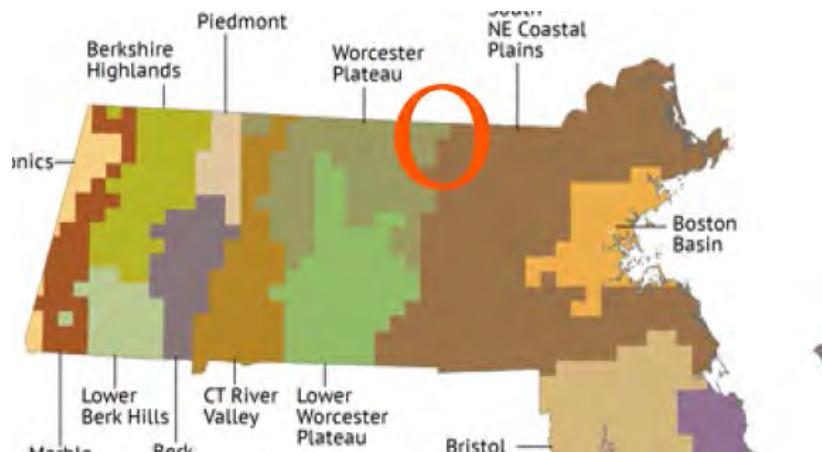

temperatures; (i.e., sedges, rushes, forbs, and grasses), removing surplus nutrients from overland runoff and preventing these and other pollutants from entering our rivers.

**Aquifers.** High-yield, high-productivity aquifers, defined as more than 300 gallons per minute, are found under several of our communities and are tapped as municipal sources of public drinking water supplies. For example, Pepperell depends on groundwater for both public and private wells, with 80% of the households dependent on its three municipal public wells. The Devens Regional Enterprise Zone (former Fort Devens military base) has three gravel-packed wells that provide nearly five million gallons per day of potable drinking water to the more than 90 businesses and 100 families that call Devens home. The West Groton Water Supply District operates wells on the bank of the Squannacook River. The Shirley Water District is Massachusetts's first ever Water District; it manages four gravel packed wells, supplying over 4,500 customers in Shirley and surrounding communities.

In Townsend, recognition of the importance of its high-yield aquifer came with the passage of the 1986 Aquifer Protection Overlay District Bylaw, which protects the aquifer from new structures and uses considered hazardous. The Wekepeke aquifer under portions of Lancaster is another high-yield aquifer, which provides a municipal backup well and could be a potential public water source for a larger region. (See **Table X** for a list of the Nashua Basin water withdrawals.)

In Hollis, two districts provide direct protection to groundwater resources. The first district, the Water Supply Conservation Zone, includes the entire stratified drift aquifer between Federal Hill Road and Proctor Hill Road (Route 130). The intent of the zone is to protect the drinking water supply for the school system and the town center area. The second district is the Aquifer Protection Overlay Zone. This district encompasses those areas designated as *stratified drift* by the United States Geological Survey in its 1986 study of the region. The district prohibits uses that would have a potential negative impact on groundwater quality. The Nissitissit River Valley aquifer, in the southwestern corner of Hollis, has a saturated thickness of only 20 feet; however, this aquifer has a transmissivity greater than 8,000 square feet per day and potential for induced infiltration from the Nissitissit River.<sup>28</sup>

Groundwater and surface water is closely linked in the glaciated terrain of New England. Groundwater provides vital recharge to streams and other water-dependent areas, such as wetlands. Dianne Timmins, Coldwater Fisheries Biologist, New Hampshire Fish and Game Department: “[groundwater is] critical to brook trout spawning success. We are studying this

<sup>28</sup> Hollis, New Hampshire, “1998 Master Plan Update,” (Adopted by Hollis Planning Board on March 16, 1999).

more in depth as we speak but preliminary data from the Dead Diamond watershed indicates increased success in areas with groundwater influence. The documented spawning sites all have groundwater plumes where the brook trout are building their redds (nests).<sup>29</sup>

As a major aquifer recharge area, the Nashua River valley stores floodwaters and precipitation in its numerous wetlands and sandy glacial soils. Maintaining flood storage capacity within the Nashua River valley is critical to preventing flooding downstream. Where the valley broadens, the river and stream beds have a flatter slope than areas upstream; where the floodplains and associated wetlands widen, the permeable sand and gravel floodplains percolate the floodwaters and act as a giant holding tank, minimizing flood damage downstream.<sup>30</sup>

**Ecoregions.** Our focus area occurs in an area of overlap of two major forest types: the Northern Hardwoods (a mixed group of sugar maple, ash, beech, and birch) and Central Hardwoods (a group dominated by oaks with some hickories). Thus, the forest vegetation of the study area is a mix of northern and central hardwoods interspersed with hemlock and white pine. These two forest types now mingle in the Nashua River watershed in what is called the transition zone, giving us a wonderfully diverse array of forest types to enjoy today. Additionally, the varied topography ranges from the “Worcester Monadnock Plateau” sub-ecoregion<sup>31</sup> in the steeper headwater sections, to more gently rolling terrain, to generally flat lowland river valleys in the east in the large “Gulf of Maine (Southern New England) Coastal Plain” sub ecoregion. Because of this elevational and topographical difference, the change in habitat over a small distance can be dramatic.

Grassland habitats decreased in New England with farm abandonment in the 1800s and have become increasingly less common with suburban sprawl and the regeneration of our forests. Yet within portions of our area, especially along the Nashua and Squannacook River floodplains, open fields are relatively widespread because farming is still active. Some areas are deliberately maintained as early successional habitats in order to preserve wildlife diversity. Examples of this can be found in several conservation parcels in our focus area that

---

29 Dianne Timmins, personal communication on February 11, 2018.

30 ACEC Nomination Report, “Central Nashua River Valley,” pages 5-6.

31 In southcentral New Hampshire this same ecoregion is described as “Hillsboro Inland Hills and Plains” (see [www.wildlife.state.nh.us/wildlife/images/wap11x17-habitat2015.jpg](http://www.wildlife.state.nh.us/wildlife/images/wap11x17-habitat2015.jpg) ).

are mowed annually to maintain an herbaceous community, such as the Watt Farm, which is part of the Oxbow National Wildlife Refuge.

It is interesting to note that historically untilled patches of forest are more likely to have higher native biodiversity than areas that were tilled and supported row crops. Dense patches of wintergreen (*Gaultheria procumbens*) have been shown to be more abundant in unplowed than plowed lands.<sup>32</sup> Wintergreen patches in large areas, for example as can readily be found along the Squannacook River, suggest that these lands have been continuously forested and likely support a greater biodiversity of microflora and fauna, as well as vascular plants, than nearby areas that were tilled.

The geology, aquifers, and ecoregions are shaping forces that give rise to many aspects of our Outstandingly Remarkable Resource Values.

## **Potential Threats to our three ORRVs:**

The Study Committee also identified some existing and future threats that could degrade the quality of each of the three ORRVs of the Nashua, Squannacook, and Nissitissit Rivers.

### **Potential threats to Biological Diversity ORRVs include, but are not limited to:**

- habitat loss and fragmentation
- significant riparian corridor land use alterations
- non-point source pollution
- terrestrial and aquatic non-native invasive species
- changes in local weather patterns such as increased intensity of drought and severe rain events

### **Potential threats to Recreational and Scenic ORRVs include, but are not limited to:**

- insufficient maintenance of access points on the rivers
- increase of invasive aquatics such as the water chestnut infestation at Pepperell Pond
- loss of opportunities to connect trails and expand the trail network
- insufficient public signage in some communities regarding the existing trail network
- increased inappropriate siting of alternative energy installations

### **Potential threats to Historic and Cultural ORRVs include, but are not limited to:**

- lack of on-going education regarding early conservationists
- under-utilization of the “Marion Stoddart Story” as inspiration and as a model
- potential lack of continuity on collection of water quality monitoring data to document river renewal
- inadequate attention to some river-related historic and cultural sites
- need for additional education of both adults and youth regarding watershed health

### ***Why Some Recommended Actions Appear in the Suggested Strategies for Multiple ORRVs***

*The three categories of Outstandingly Remarkable Resource Values that have been identified for the Nashua, Squannacook, and Nissitissit Rivers are inextricably linked with each other. Thus it is not surprising that a recommended action item that might protect a biological diversity value could be the same, or very similar, recommended action item suggested to protect a recreational and scenic value, and indeed also a historical and cultural value. Suggested actions to maintain or expand a naturally vegetated buffer along the rivers is an example of a recommended action fitting in all categories. The Nashua River Wild and Scenic River Study Committee decided to support this seeming duplication, especially as there might be instances where a user of the Plan would, for their own interests, focus on only one category. We would want the set of recommended actions considered by such a user to be "complete."*

## **ORRV #1 –BIOLOGICAL DIVERSITY**

*Photo: 1 Ken Hartlage*

*Photo: 2 MassWildlife*

A consequence of the confluence of distinct ecoregions and transitions between them, as described in the preceding “Shaping Forces” section of this Chapter, is that our area supports outstanding overall biodiversity. While area residents delight in sightings of a vast array of flora and fauna—including cardinal flowers along the shores, a bobcat refreshing itself with a drink of river water, and bald eagles soaring above the waterways—it is the turtles, fish, mussels, and dragonflies, in part, that help define our rivers as having rare, unique, or exemplary features meriting Wild and Scenic designation.

**Biodiversity.** Biological and ecological diversity in the area can be measured by the sheer number of species and by the number of species assemblages (natural communities of plant and animal species that share a common environment and occur together repeatedly on the landscape). Abundant wetlands, grasslands, and uplands shelter many rare species, most of which need more than one habitat to survive, or depend upon increasingly rare habitats. Another benefit of the protected areas around our area's several aquifers is that many Massachusetts Natural Heritage and Endangered Species Program (NHESP) Priority and Estimated Habitats are found overlying them.

Having a high number of state-listed rare species in the focus area is largely a function of the existence of intact special habitats and/or natural communities and the large extent of contiguous open space. The Nashua, Squannacook, and Nissitissit Rivers—as well as the Unkety Brook tributary to the Nashua River—are described by NHESP in its 2012 “BioMap2: Conserving the Biodiversity of Massachusetts in a Changing World” Report as:

...the watery framework for a complex landscape that supports an exceptionally high number of rare and uncommon species. Forty-one such turtles, dragonflies, freshwater mussels, salamanders, plants and other species inhabit these rivers, brooks, and vernal pools. Good populations of the globally rare Brook Floater mussel inhabit the Nissitissit River, while the equally rare Ringed Boghaunter dragonfly can be found in four boggy sites across this large Core Habitat.<sup>33</sup>

**Priority Natural Communities.** The Nashua River corridor consists of significant portions of terrestrial habitat designated by the Commonwealth’s BioMap2 project as “core habitat,” representing the highest priority for biodiversity conservation and protection.

([www.mass.gov/eea/agencies/dfg/dfw/natural-heritage/land-protection-and-management/biomap2/](http://www.mass.gov/eea/agencies/dfg/dfw/natural-heritage/land-protection-and-management/biomap2/))

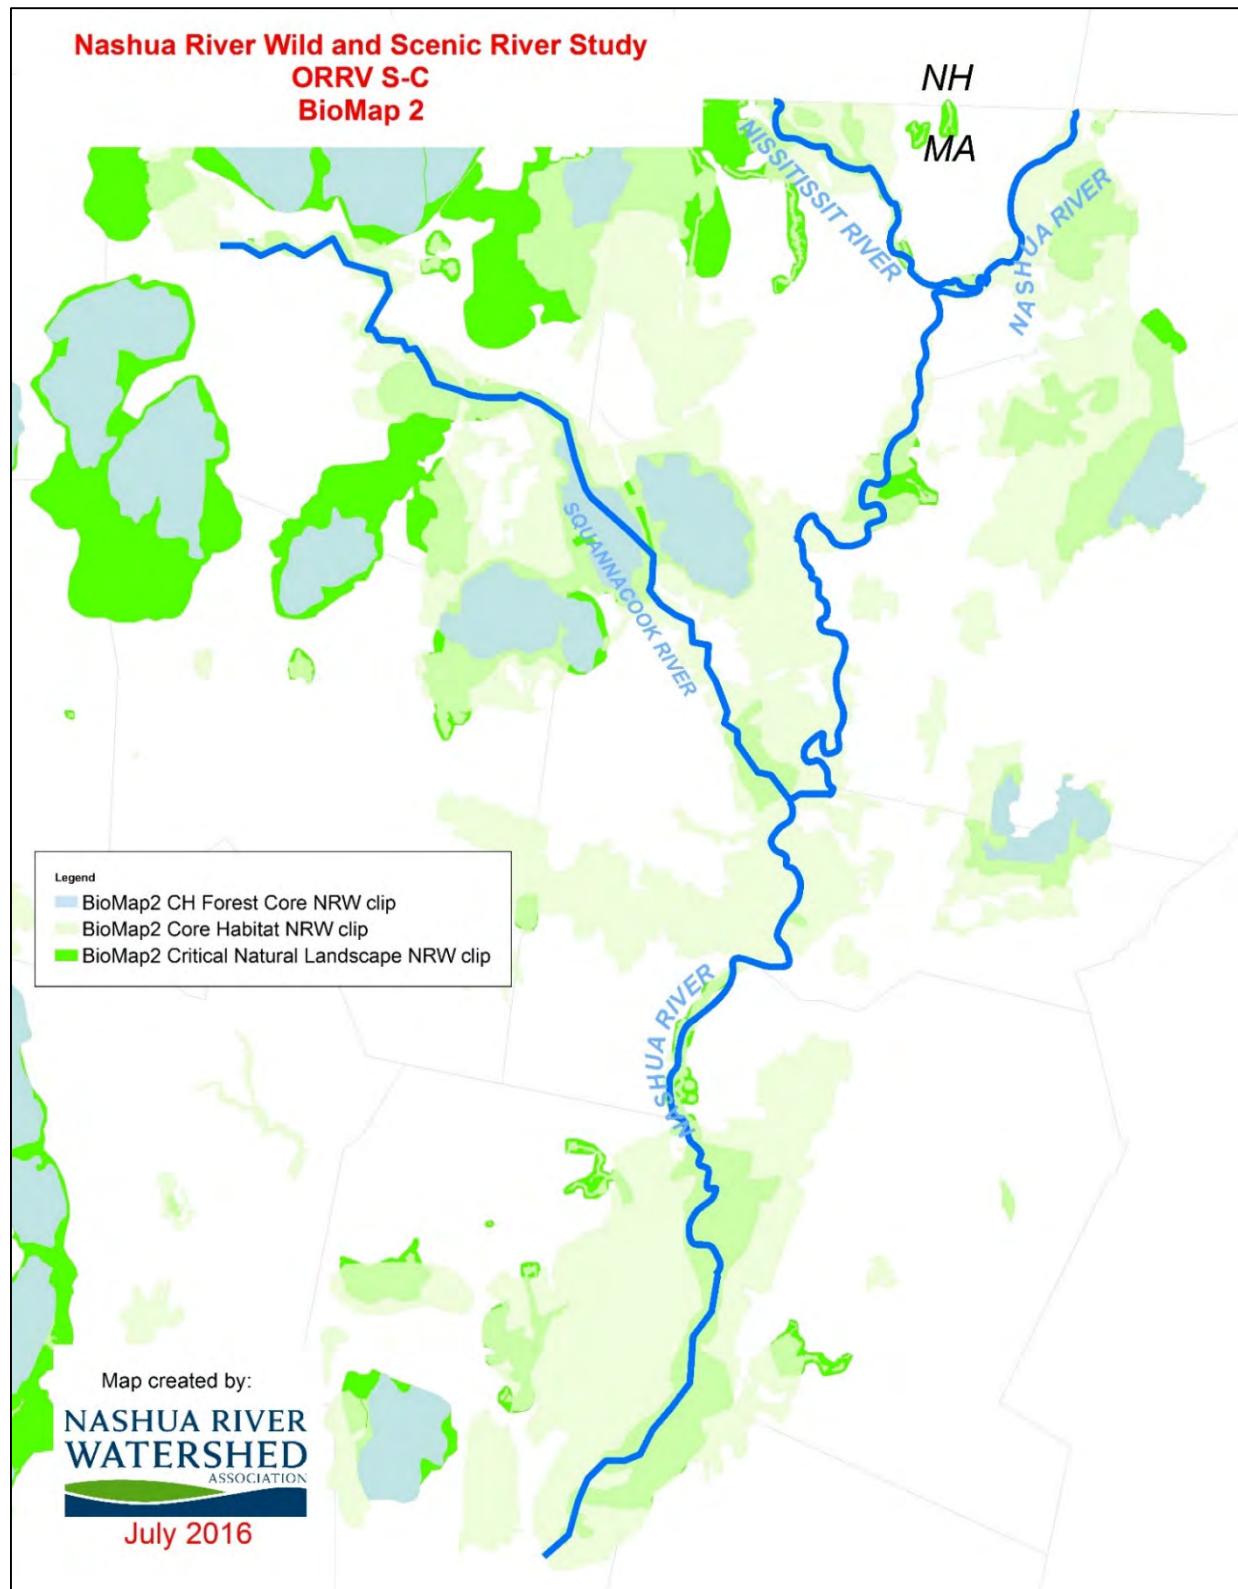

---

<sup>33</sup> Natural Heritage and Endangered Species Program, *BioMap2: Conserving the Biodiversity of Massachusetts in a Changing World* (2012)

Lovering Farm, on the Nashua River in Harvard, is pictured on May 27, 1894. The Nashua River played an important role in the history of Harvard. When the town incorporated in 1732, the Nashua defined Harvard's western boundary. Some 10,000 years ago, this area was a glacial lake bed. Clay from this glacial lake bottom was also mined to make bricks. The fertile lands along the banks of the river were some of the best agricultural lands in town. Interestingly, patterns of property ownership for these fertile bottom lands differed from the adjacent lands upslope to the east. In general, the choice agricultural bottom land lots were much smaller and changed hands more frequently. Over the years, the river meandered around this flat flood plane, creating a series of oxbows, now the Oxbow Wildlife Refuge. Over the years, the river provided a natural transportation route to Lowell and the Merrimack River to the north. In 1847, the railroad took advantage of the flat land when it built the Worcester Nashua line just to the east of the Nashua River.

*Photo: "Images of America: Harvard"*

Additionally, six Massachusetts NHESP exemplary or “Priority Natural Communities”<sup>34</sup> occur along the Nashua River:

- Kettlehole Level Bog (Groton)
- Pitch Pine–Scrub Oak (PP/SO) Community (Lancaster)
- Red Maple–Black Ash Swamp (Ayer)
- Alluvial Red Maple Swamp (Harvard)
- Small-River Floodplain Forest (Ayer)
- High-terrace Floodplain Forest (Bolton and Lancaster)

Since few intact floodplain forests remain in New England, these are considered to be among the rarest forest type in the region.<sup>35</sup> Also, MassWildlife has made the Pine Hill area, adjacent to the Nashua River in Lancaster, a priority to preserve and to protect because it has some of Central Massachusetts’s last remaining Pitch Pine–Scrub Oak (PP/SO) patches. PP/SOs are a unique habitat—threatened by forest fragmentation—that occur on outwash sandplains, which are themselves much reduced in the focus area (and statewide) because of their ease of development and attractive for sand and gravel mining.

**ACECs.** There are three Areas of Critical Environmental Concern (ACEC) in our focus area: the Central Nashua River Valley ACEC (12,900 acres, 1996), the Squannassit ACEC (37,450 acres, 2002), and Petapawag ACEC—“swamps on a hill”—(25,630 acres, 2002).

Massachusetts’s ACEC’s “...receive special recognition because of the quality, uniqueness and significance of their natural and cultural resource.”<sup>36</sup> For example, Petapawag ACEC is most important for the diversity of wildlife and rare species: the NHESP database indicates that

---

Note that there are no corresponding state designations of either Priority Natural Communities nor BioMap in New Hampshire.

35 See The Nature Conservancy, New Hampshire: A Question of Flow at [www.nature.org/ourinitiatives/regions/northamerica/unitedstates/newhampshire/freshwater/a-question-of-flow-for-floodplain-forests.xml](http://www.nature.org/ourinitiatives/regions/northamerica/unitedstates/newhampshire/freshwater/a-question-of-flow-for-floodplain-forests.xml). For more see University of New Hampshire’s Habitat Stewardship Series: Floodplain Forests at [https://extension.unh.edu/resources/files/Resource000414\\_Rep436.pdf](https://extension.unh.edu/resources/files/Resource000414_Rep436.pdf)

36 For an overview of the ACEC program, see [www.mass.gov/service-details/acec-program-overview](http://www.mass.gov/service-details/acec-program-overview).

there are sixteen state-listed<sup>37</sup> rare species and one federally listed threatened species in this one ACEC.

More specifically, within the Squannassit ACEC, the Nissitissit River sub-watershed includes sightings of American bittern (endangered), brook snaketail (dragonfly, special concern), spotted turtle (formerly of special concern), and wood turtle (special concern). The Squannacook River corridor has several records of rare species including the marble salamander (threatened), Blanding's turtle (threatened in Massachusetts and petitioned for federal listing; see <https://ecos.fws.gov/ecp0/profile/speciesProfile?spcode=C05M>), creeper (mussels, special concern), bridle shiner (minnow, special concern), and wood turtles (special concern).

Note: According to Mike Jones, Massachusetts State Herpetologist:<sup>38</sup>

...the Nashua [River] is also the site of some of the earliest scientific observations on wood turtles, which need restoration efforts....Beginning in 1854, Sanborn Tenney and Louis Agassiz studied a population in Lancaster, described in Agassiz' *Contributions to the Natural History of the United States*.<sup>39</sup>

The Nashua River corridor provides breeding and migration habitat for listed bird species such as king rail, pied-billed grebes, and common moorhens, and provides potential habitat for American and least bittern as well as the blue spotted salamander and the water shrew, both of which are dependent on the interspersion of wetland and terrestrial habitats.

**Turtles.** Our focus area is also the home of the largest known population of state-listed Blanding's turtle: according to herpetologist Brian Butler, ours is the only core Blanding's habitat in Massachusetts. Mike Jones, Massachusetts State Herpetologist, writes, "the Nashua River watershed supports the largest contiguous and unfragmented population of Blanding's in

---

37 As listed in 321 CMR 10.90, March 10, 2017 "There are 169 species of animals and 258 species of plants that are protected under the Massachusetts Endangered Species Act. These 427 native species are *state-listed* as Endangered, Threatened, or of Special Concern and are tracked in a database. These species are either at risk, or may become at risk, of extinction. Rarity in the state, population trend, and overall threat are the main criteria used to determine extinction risk." ([www.mass.gov/service-details/list-of-endangered-threatened-and-special-concern-species](http://www.mass.gov/service-details/list-of-endangered-threatened-and-special-concern-species)).

38 Mike Jones, personal communication on December 19, 2016.

39 In speaking of occurrence of wood turtles in Lancaster, Massachusetts, Agassiz says it "is so common in the neighborhood. . .that I have at times collected over one hundred specimens in an afternoon...." Louis Agassiz, *Contributions to the Natural History of the United States*, (Little Brown and Company, vol. 1, 1857) page 294.

Massachusetts.”<sup>40</sup> NHESP calls it “...a very significant population, possibly the largest in New England.”<sup>41</sup> According to the Commonwealth’s *BioMap2*, Blanding’s turtles use many parts of this landscape throughout their decades-long lives, from feeding and over-wintering in deep vernal pools and buttonbush shrub swamps to nesting in open, sunny, well-drained fields and abandoned gravel pits. Because of their extensive movements over the course of the year, Blanding’s turtles require larger landscapes than many other turtle species.<sup>42</sup>

Loss of only a few adults annually can cause populations to decline as they do not reproduce until late in life (14–20 years), and they have low replacement rates due to low nest and juvenile survivorship. Roads are the primary cause of adult mortality. Despite concerns about the ongoing decline attributable to the lack of suitable nesting sites and continued road mortality, this local population appears to be healthy and growing—it is a regional stronghold—and will continue to do so as long as their travel corridors and habitats are protected. Indeed, in 2002, the region was being considered as having two of only nine “state herpetofauna reserves” due to the “presence of multiple rare herptile species, relative lack of habitat fragmentation, and diversity of wetland types.”<sup>43</sup>

The proposed 18,000-acre Unkety Brook Herp Reserve was to include the northern half of the proposed Petapawag ACEC, plus additional areas. This herp reserve was delineated to protect populations of Blanding’s turtles, spotted turtles (at that time on Massachusetts’s rare species list), and blue-spotted salamanders. Only three of the nine proposed herp reserves were known to harbor more than two of the targeted rare reptiles and amphibians; the proposed Unkety

41 See Area Of Critical Environmental Concern: Designation of the Central Nashua River Valley at [www.mass.gov/eea/docs/dcr/stewardship/acec/acecs/cnr-des.pdf](http://www.mass.gov/eea/docs/dcr/stewardship/acec/acecs/cnr-des.pdf), page 5.

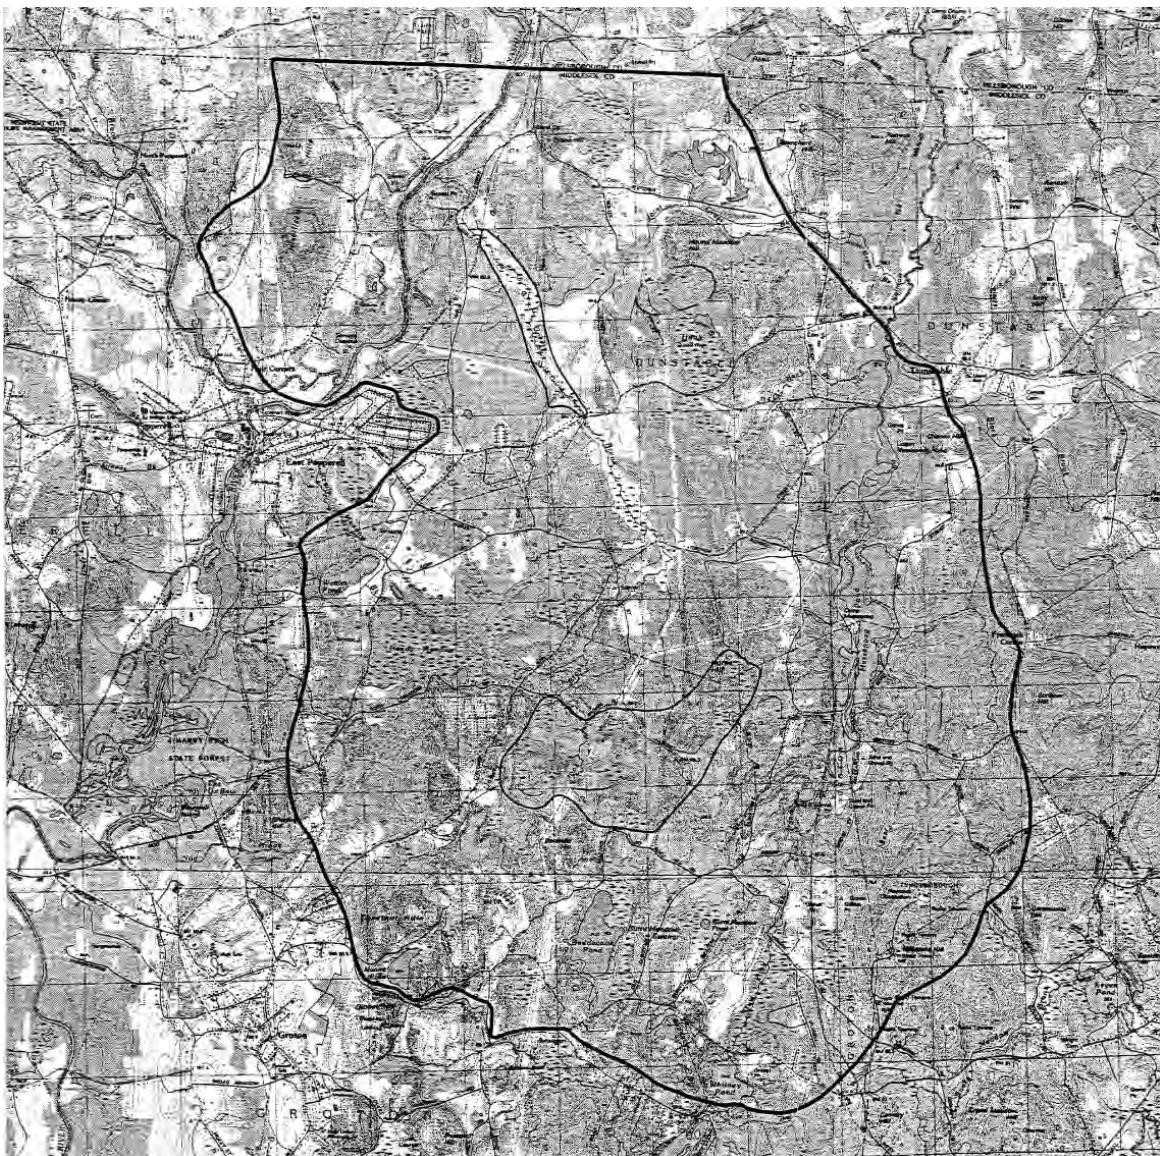

42 [www.fws.gov/northeast/ecologicalservices/turtle/species/blandingsturtle.html](http://www.fws.gov/northeast/ecologicalservices/turtle/species/blandingsturtle.html)

43 From 1998 through 2000, the Massachusetts NHESP surveyed sites across the state for state-listed rare reptiles and amphibians, eventually choosing nine areas as potential “herp reserves” because of the presence of multiple rare herptile species, relative lack of habitat fragmentation, and diversity of wetland types interspersed with undeveloped uplands. The reserve areas were delineated around known rare species sites based on dispersal distances and habitat use for each rare herptile species represented at a site, so that the population of each species could have a high likelihood of long-term persistence. The proposed 6,700-acre Squannacook Herp Reserve would have been almost completely incorporated into the eastern portion of the Squannassit ACEC, with a small part in the Petapawag ACEC. This reserve was delineated to protect populations of Blanding’s and Spotted Turtles and appears to contain the highest density of vernal pools of all nine contemplated herp reserves in Massachusetts. [www.mass.gov/eea/docs/dcr/stewardship/acec/acecs/petwag.pdf](http://www.mass.gov/eea/docs/dcr/stewardship/acec/acecs/petwag.pdf).

Brook Herp Reserve was one of those three. This herp reserve would have been the largest of the herp reserves delineated across the Commonwealth, if that project had gone forward.

As the Natural Heritage report – unpublished -- on the project stated, “...the Unkety site may be key to the persistence of Blanding’s turtles in Massachusetts and may be essential to maintaining connectivity with populations of target species in New Hampshire and Maine.”

Additionally, two dozen other state-listed threatened, endangered, or species of special concern exist in the focus area. The majority of fauna on the Massachusetts List of Endangered, Threatened, or Special Concern Species are so designated because of loss of habitat to development. Without places to breed, nest, and find food, they have little chance of long-term survival. Part of the goal of this Stewardship Plan is to help educate the public about the value of identifying and protecting large contiguous areas of undeveloped land as wildlife habitat.

*Figure 3: Recommended herptile reserve 2*

**Fish and Mussels.** In 1974, a stream survey of the Nashua River system found only aquatic species most tolerant of pollution. Today, the Nashua River supports a substantial warmwater game fishery (including large-mouth bass, chain pickerel, brown trout, fallfish, carp, blacknose dace, black crappie, common and golden shiner, brown bullhead, tessellated darter, yellow and white perch, white sucker, slimy sculpin, and bluegill),<sup>44</sup> which is heavily used by recreational anglers. It is also “fished” by mink, otter, mergansers, bald eagles, osprey, and great blue heron. Brook trout spawn in the tributaries and travel to the Nashua River for part of each year. The burgeoning fish population in the mainstem Nashua River is sustained by all the surrounding open water wetlands. American eel exist in the Nashua and Squannacook Rivers, and upstream eel (elvers) passage has been installed at Ice House Dam on the Nashua River, though there is no fish passage.

---

<sup>44</sup> Ibid, [www.mass.gov/eea/docs/dcr/stewardship/acec/acecs/petwag.pdf](http://www.mass.gov/eea/docs/dcr/stewardship/acec/acecs/petwag.pdf).

The Nissitissit River and its tributaries—particularly, Gulf, Mine, and Sucker Brooks—are coldwater fisheries resources<sup>45</sup> (“CFR”; Massachusetts Department of Fish and Game 2015) containing native brook trout. There are over twenty tributaries to the Nashua, Squannacook, and Nissitissit Rivers that are state-defined coldwater fishery resources—as are the Squannacook and Nissitissit Rivers themselves. The Squannacook River<sup>46</sup> supports a native trout population in its upper end, and its main tributaries -- Willard, Trapfalls, and Locke Brook support native brook trout. It is likely that some of these trout find their way into the mainstem Nashua River.<sup>47</sup>

The Squannacook-Nissitissit Rivers Sanctuary Act (MGL 132A:17, 1975) was passed to protect the Outstanding Resource Waters (ORWs) of these two rivers and associated named tributaries from degradation by new discharges of pollution. Therese Beaudoin, Massachusetts Department of Environmental Protection (DEP) Watershed Coordinator, stated in a personal communication:

The Massachusetts DEP has studied water quality in the Nashua Watershed since the late 1960s. The Squannacook River has provided an ideal location for establishing least impacted conditions for both water quality and flow, and has **served as a reference river for decades**. A **long term monitoring station** was established here in 1998, with sampling conducted every two months; available data show that water quality and aesthetics in the Squannacook River have been consistently among the cleanest in Central Massachusetts.” (emphasis added)

The Nissitissit River is home to five species of freshwater mussel—one of the most highly endangered animal groups in North America—which require clean water.<sup>48</sup> In Massachusetts, freshwater mussels are a Species of Greatest Conservation Need (SGCN) by MassWildlife and good sites need to be protected.<sup>49</sup> Two listed under the Massachusetts Endangered Species Act (MESA) are: the creeper (special concern) and the brook floater (endangered and also listed as

---

45 A Coldwater Fish Resource (CFR) is a waterbody where reproducing Coldwater Fish use such waters to meet one or more of their life history requirements. CFRs are particularly sensitive habitats. Changes in land and water use can reduce the ability of these waters to support trout and other kinds of coldwater fish. Identification of CFRs is based on fish samples collected annually by staff biologists and technicians. See: [www.mass.gov/service-details/what-is-a-cfr](http://www.mass.gov/service-details/what-is-a-cfr)

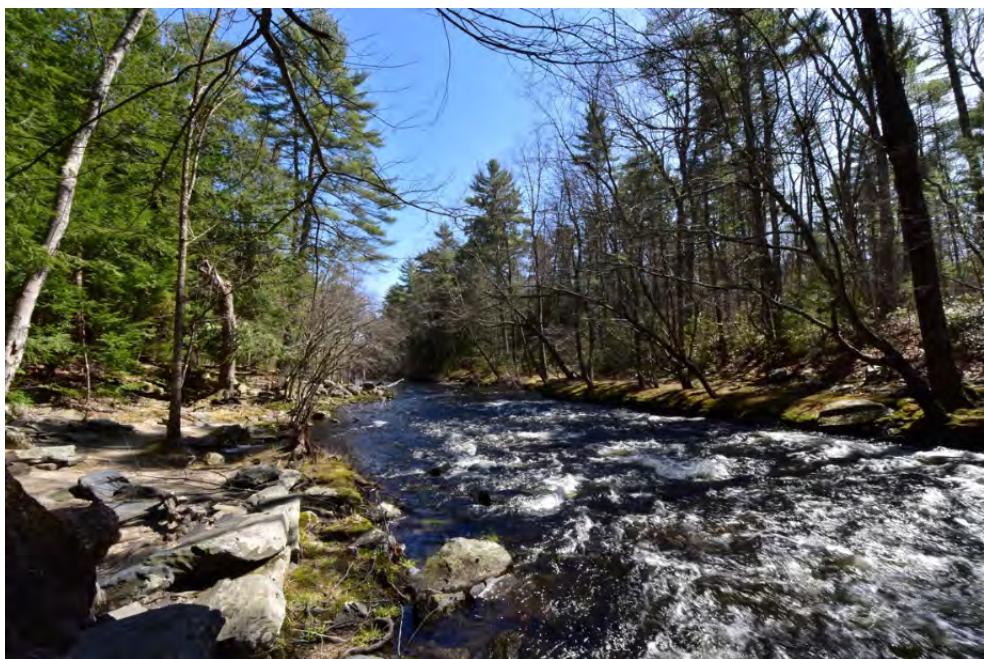

46 One may hear that the Native American (Nipmuc) name *Squannacook* means “place for taking salmon.”

47 USFWS Oxbow National Wildlife Refuge, *Final Comprehensive Conservation Plan*, February 2005.

48 “University of New Hampshire zoologist Don Chandler and his students have found that riffle beetles, a species that lives in fresh water, are especially sensitive to water quality. When the water is clean, they thrive. In the Nissitissit River Chandler’s team found 13 out of the 17 species of the insect known to exist in the state, a sign that the river is unusually clean.” <http://unhmagazine.unh.edu/f99/finickybugs.html>.

49 Pat Swain Rice, personal communication in 2016.

endangered under New Hampshire's Endangered Species Conservation Act), notable as one of just four populations in the Commonwealth. In fact, “the Nissitissit River was ranked as a conservation priority stream based on its relatively healthy *A. varicosa* population [brook floater]” [and additionally] “...named as a conservation priority because of immediate threats to *A. varicosa* populations.” (*Confirmed Occurrences and Population Assessment of the Brook Floater in Massachusetts*, draft report, unpublished, February 2016) The recent 2015 removal of the Millie Turner Dam on the Nissitissit River in Pepperell is believed to have a beneficial impact on the mussels in the river, as it will both cool the water and reconnect populations up and downstream of the former dam.

The dwarf wedge mussel is a federally listed species<sup>50</sup> found in the Nissitissit River. Eastern pearlshell also in the Nissitissit River and the Creeper mussel present in the Squannacook River in Townsend are listed as species of conservation need in the *Massachusetts State Wildlife Action Plan*. Also, the creeper mussel (Special Concern) and triangle floater (Species of Greatest Conservation Need) are present in the Nashua River.<sup>51</sup>

---

50 See US Fish and Wildlife Service Environmental Conservation Online System at <https://ecos.fws.gov/ecp0/profile/speciesProfile?sId=784>.

51 Biodiversity, LLC, “Freshwater Mussel Survey in the Nashua River in the Bypass Reach, Tailrace, and Impoundment of the East Pepperell Dam Pepperell, Massachusetts,” (May 2013) page 1.

As part of the Trout Unlimited’s “Brook Trout Initiative”, the Squan-a-Tissit Chapter of Trout Unlimited assessed the Nissitissit River and its tributaries to identify areas where restoration or protection efforts would most help protect the native brook trout populations.

**Dragonflies.** The ringed boghaunter, designated as Massachusetts state threatened, is found along the Nashua River in the vicinity of the Oxbow National Wildlife Refuge. Five species of state-listed dragonfly species—brook snaketail, forcipate emerald, Kennedy's emerald, spine-crowned clubtail, and umber shadowdragon—occur in the Squannacook River corridor. The spine-crowned clubtail is found in the Nissitissit River corridor as well. Such a multiplicity of dragonflies and freshwater mussel species present in the Squannacook emphasize the high water quality of that river and its importance in providing habitat for a variety of other species, common and rare.<sup>52</sup>

*Ophiogomphus aspersus*, the Brook Snaketail, is an indicator of high quality small/medium sized rivers/streams. I have collected this species in both the Nissitissit and Squannacook Rivers. This species is characteristic of clean, sandy-bottomed rivers and streams that flow through forests and they thrive in medium gradient rivers/streams with abundant riffles and sandy substrate.... The Bertozi Wildlife Management Area has been well known among Odonotists in Massachusetts for its odonate diversity: there are records going back decades. It's hard to find a single location in MA where one can find as many species of odonates in one day during late spring/early summer when the adult odonates are at their peak abundance. I have personally collected 71 species of odonates either on the Squannacook River proper or in adjacent wetlands, and likewise 57 species on the Nissitissit.<sup>53</sup>

**Birds.** During the spring and fall bird migrations, the Nashua River is the second most commonly followed flyway in Massachusetts, after the coast. This migratory bird mecca has over 230 bird species, half of them nesting.<sup>54</sup> In particular, the open field grassland habitat—found at the Bolton Flats Wildlife Management Area and in Devens at the Moore Airfield and Shepley Landfill—provides nesting sites for the state endangered upland sandpiper and the threatened grasshopper sparrow.<sup>55</sup> Additionally, the Pine Hill area in Lancaster, mentioned above with regard to its exemplary Pitch Pine–Scrub Oak natural community, has documented vesper and grasshopper sparrow territories on it according to Chris Buelow, NHESP

Restoration Ecologist.<sup>56</sup> See Audubon Society’s “Nashua River Watershed Important Bird Area (IBA) Site for further discussion of this site.”<sup>57</sup> Continuing along the Atlantic flyway into New Hampshire, migratory birds would follow the Nashua River north to the Merrimack River to or from their breeding areas. Some birds, like the common redpoll, stop in New Hampshire, as this is their northern breeding ground.<sup>58</sup>

*Photo: 3 Both photos Ken Hartlage*

*Map 2 MassAudubon IBA website*

This Nashua River Watershed IBA is composed of the Oxbow National Wildlife Refuge, Devens Reserve Forces Training Area (Devens RFTA), Bolton Flats Wildlife Management Area, the Nashua Greenway, Lancaster State Forest, and private lands along the Nashua River that are contiguous with the publicly owned areas. Much of this land was part of the former Fort Devens. A large portion of the former Fort Devens was transferred to the US Fish and Wildlife Service and is now the Oxbow National Wildlife Refuge. The area between the wildlife refuge, Devens RFTA, and Bolton Flats is known as the Intervale Region and is

---

56 Chris Buelow, email communication on June 19, 2014.

57 Mass Audubon Society Important Bird Area (IBA) at [www.massaudubon.org/our-conservation-work/wildlife-research-conservation/statewide-bird-monitoring/massachusetts-important-bird-areas-iba/important-bird-area-sites/nashua-river-watershed](http://www.massaudubon.org/our-conservation-work/wildlife-research-conservation/statewide-bird-monitoring/massachusetts-important-bird-areas-iba/important-bird-area-sites/nashua-river-watershed).

This IBA includes large areas of upland and wetland habitats including grassland, wetlands, forest, and the riparian corridor. Much of the land in the IBA is owned by the federal government. It provides important habitat for upland species including declining grassland birds and a wide diversity of migratory songbirds, as well as wetland dependent species like waterfowl, rails, and bitterns. Raptors of concern known to utilize the area include the bald eagle, peregrine falcon, northern harrier, and sharp-shinned hawk. The IBA has no specific regulatory significance or authority; the program identifies areas of particularly significant bird habitat to educate people about the importance of these areas and draw attention to the need to consider the avian resources in land management plans and decisions.” (Personal communication with Heidi Ricci, Mass Audubon, Oct. 25, 2017)

58 Pamela D. Hunt et al., “The State of New Hampshire’s Birds—A Conservation Guide,” (New Hampshire Audubon, Concord, NH 2010).

primarily privately owned, except for a small parcel of Lancaster conservation land. The public portion is composed of Lancaster conservation land called the Nashua Greenway and the Lancaster State Forest.

The diverse habitats are reflected in a rich avifauna. The habitats include a large grassland, extensive wetlands, forested uplands, and a riverine corridor. The forest communities are Appalachian oak-pine forest, hemlock-northern hardwood forest, red maple hardwood swamps, and pitch pine-scrub oak barrens. The wetland communities present are equally diverse and include New England floodplain forest, dwarf shrub bogs, a black spruce-tamarack bog, oxbow ponds, and sandy bottom kettlehole ponds. The grassland is particularly important as the site hosting the state's third largest breeding population of grasshopper sparrows as well as supporting vesper sparrows, upland sandpipers, and bobolinks.

## Some Key Findings on the Exemplary Status of Biodiversity Features

- The Oxbow National Wildlife Refuge, which has 1,667 acres and approximately eight miles of Nashua River frontage, is the crown jewel of permanently protected land in our study area.
- The Nashua River corridor consists of significant portions of terrestrial habitat designated by the Massachusetts BioMap2 project as “core habitat,” representing the highest priority for biodiversity conservation and protection. There are six “Priority Natural Communities” along the Nashua River, according to Massachusetts Natural Heritage and Endangered Species Program (NHESP).
- Three state-designated ACECs are in our area covering a total of approximately 76,000 acres: the Central Nashua River Valley, Squannassit, and Petapawag ACECs. Together these three contiguous ACEC’s comprise approximately 28% of total existing ACEC’s throughout the Commonwealth. ACECs are “areas where unique clusters of natural and human resource values exist and which are worthy of a high level of concern and protection.”
- The 1975 Squannacook-Nissitissit Rivers Sanctuary Act was passed to protect the ORWs of these two rivers and associated named tributaries from degradation by new discharges of pollution.
- The Squannacook River has served for decades as a Massachusetts state reference (or “baseline”) river for least-altered flow patterns<sup>59</sup> and was used to develop the state’s water withdrawal policy. A long-term monitoring station was established there in 1998, with sampling conducted every two months; available data show that water quality and aesthetics in the Squannacook River have been consistently among the cleanest in Central Massachusetts.
- “Many of the tributaries connected to the lower Nashua River (i.e., downstream from Wachusett Reservoir), together with the Nissitissit River, Squannacook River, and associated tributaries, represent the most substantial concentration of coldwater fish

---

<sup>59</sup> US Geological Survey, “Characteristics and classification of least altered streamflows in Massachusetts,” (Scientific Investigations Report 2007-5291, 2008).

resources in the eastern third of Massachusetts. The location of these resources also makes this complex of coldwater streams the closest significant recreational stream trout fishery to the Boston metropolitan area.”<sup>60</sup>

- The Nissitissit River is unique in eastern Massachusetts for having both a "Fly Fishing Only" and “Catch and Release” section. The recent removal of the Millie Turner Dam<sup>61</sup> in Pepperell is expected to improve flows and benefit the river’s wild brook trout population. Further, due to conservation efforts, nearly 50% of the entire length of the Nissitissit River has a 300-foot vegetated buffer strip.<sup>62</sup>
- Twenty-five tributaries to the Nashua, Squannacook, and Nissitissit Rivers are Massachusetts coldwater fishery resources (CFR), as are the Squannacook and Nissitissit Rivers.
- The US Fish and Wildlife Service (FWS) has stocked alewife and American Shad in an impounded pond on the Nissitissit River in New Hampshire and is pursuing a goal to reintroduce same species to the Nashua River in the next ten years.
- The Nashua River is the second most commonly followed flyway in Massachusetts, after the coast.<sup>63</sup> The Oxbow National Wildlife Refuge is listed as a priority for protection under the North American Waterfowl Management Plan and the Emergency Wetlands Resources Act of 1986.

---

<sup>60</sup> Adam Kautza, Coldwater Fisheries Project Leader at MassWildlife, personal communication on June 1, 2017.

<sup>61</sup> (Former) Turner Dam – In 1750, Turner Dam was constructed and associated with grist and sawmills. In 1838, Blake and Ballard machine shop was established on site. In 1864, Blake Brothers produced “Improved Turbine Water Wheel,” a “belt fastener” that they invented and patented; the turbine is sold nationally and internationally. In 1942, Robert and Millie Turner purchased property and razed the industrial buildings on site (ca. 1947). Dam failure occurred in 1954 caused by upstream dam breach (Potanipo Pond) and heavy ice flows. In 1956, the dam was reconstructed by Paugus Rod and Gun Club and a group of local volunteers. The property was conveyed to David Babin by Millie Turner in 2008. And in 2010, Massachusetts Department of Fish and Game purchased 17 acres from Mr. Babin for conservation purposes; the dam and underlying land (0.47 ac) was excluded. Massachusetts Division of Ecological Restoration accepted dam removal as a state Priority Project for river restoration in 2013. The dam was removed with mussel relocation, and completion of 0.47-acre property transfer to the Commonwealth in 2015.

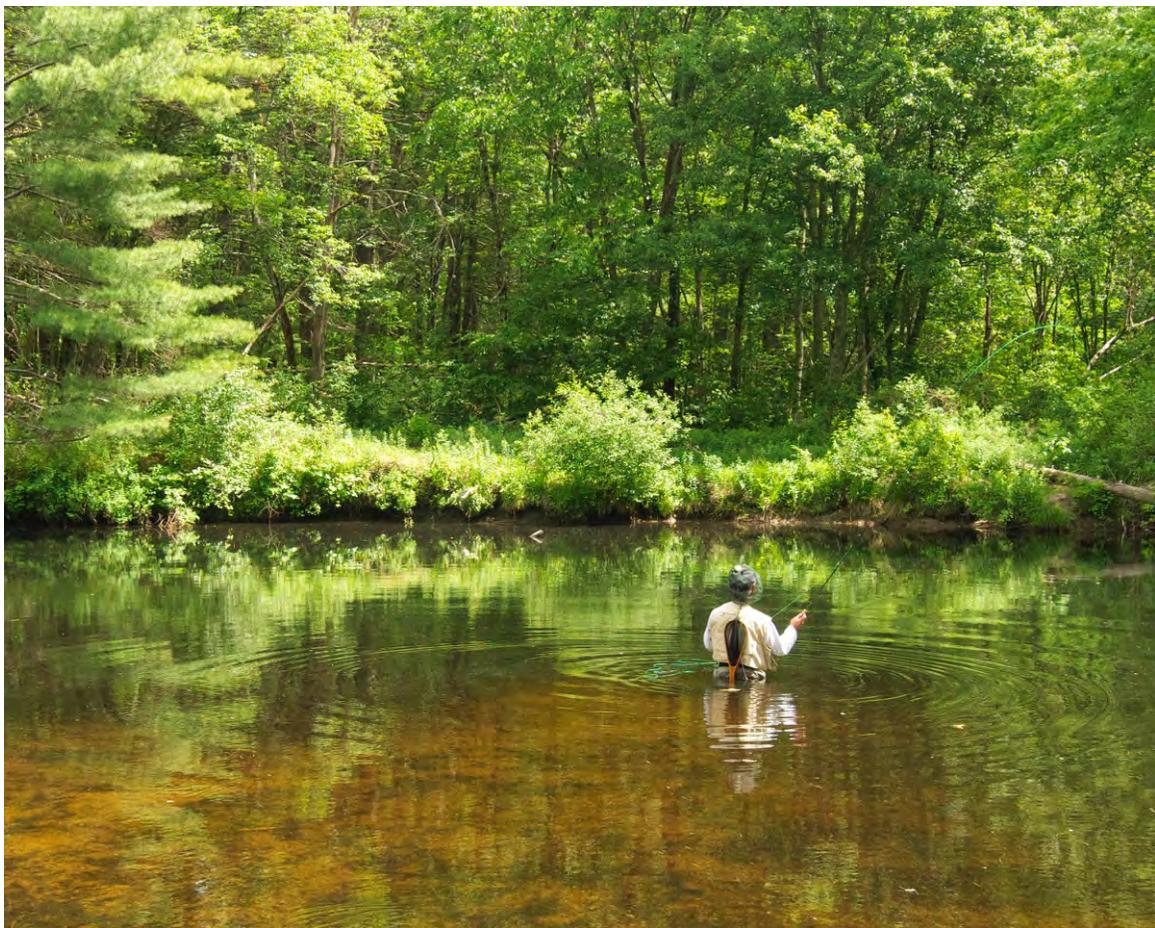

<sup>62</sup> Harvard has a Nashua River Watershed Greenspace Buffer District. See the Zoning Bylaw, 125-42.B(9). This is 300-foot-wide from the Nashua River in Harvard.

<sup>63</sup> Dunstable Open Space and Recreation Plan 2010-2017.

- As a major aquifer recharge area, the Nashua River valley stores floodwaters and precipitation in its numerous wetlands and sandy glacial soils. Another benefit of our focus area's several aquifers is that many Massachusetts NHESP Priority and Estimated Habitats are found overlying them.
- Some two dozen state-listed Massachusetts NHESP threatened, endangered, or species of special concern exist in this region. Five species of state-listed dragonfly species occur in the Squannacook River corridor. The Nissitissit River is home to six species of freshwater mussel—one of the most highly endangered animal groups in North America—which require clean water. The river was ranked as a conservation priority stream because of such. The entire length of the Nissitissit in Massachusetts is identified as Natural Heritage Priority Habitat for five listed species. Such a multiplicity of dragonflies and freshwater mussel species present in the Squannacook and Nissitissit emphasize the high water quality of those rivers.
- Our focus area is also the home of the largest known population of Massachusetts-listed and New Hampshire-listed Blanding's turtle: Massachusetts NHESP calls it "...a very significant population, possibly the largest in New England."<sup>64</sup>
- Nearly the entire Nashua River watershed has been included as the "Nashua River Greenway Forest Legacy Area" under the US Forest Service administered Forestry Legacy Program in partnership with Massachusetts Department of Conservation and Recreation's Bureau of Forestry. Two outstanding tracts protected by Forest Legacy in our study area are the Belmont Springs tract (255 acres in Pepperell) and the Pumpkin Brook Link tract (174 acres in Shirley).

---

<sup>64</sup> Mike Jones, personal communication on December 19, 2016.

## Biological Diversity Action Plan

### A: Biological Diversity

**GOAL A.1: Sustain and enhance existing biological diversity along and within the rivers and their tributaries.**

**Objective: Ensure that the outstanding existing biological richness of the rivers' aquatic and bordering terrestrial communities will be sustained and enhanced into the future, that common species will remain common, and that populations of rare and threatened species are not extirpated.**

- **Engage the public** - Use a variety of media to help audiences from youth to senior citizens learn about the rich biological legacy along the region's rivers and streams; the relationships between human activities, wildlife, and plant habitat needs; and conservation actions and outcomes. Provide rich field experiences and programs to help residents and visitors to the region develop and increase their connections with the natural world of the rivers and their shores.
- **Address nonpoint source pollution** - Work with communities and landowners to address issues of nonpoint source pollution, especially stormwater runoff and flows from disturbed areas, septic system discharges, and other sources of water quality impairment. Develop strategies to help mitigate effects of global warming.
- **Protect riparian zones** - Work with communities and landowners to protect riparian zones from unnecessary clearing and land alteration.
- **Conserve contiguous habitat** - Help communities identify conservation strategies that will provide contiguous habitat, corridors, and linkages among habitat types to address the needs of diverse plant and wildlife populations.
- **Conserve critical habitat** - Work with local land trusts, local, state, and federal officials, and landowners to conserve critical habitats along the rivers and nearby uplands.
- **Conserve targeted species** - Carry out targeted activities focused on species and communities of particular conservation interest, as detailed below.

## GOAL A.2: Protect Priority Natural Communities & Rare Species Habitats.

**Objective: Protect habitats and corridors identified as high priority by Massachusetts Natural Heritage and Endangered Species Program (NHESP) and by New Hampshire Natural Heritage Bureau (NHB), and by doing so, sustain and enhance important biological communities and species.**

- **Inform the public** - Provide a variety of information through many media and programs to inform residents and visitors about unique/special communities and rare species, and their needs.
- **Encourage best practices for habitat management** - Encourage habitat management, such as according to MassWildlife recommendations, for early successional/young forest.<sup>65</sup>
- **Protect endangered species** - Help municipalities and land trusts permanently protect all occurrences of state-recognized NHESP Priority Natural Communities along the Nashua River, according to Massachusetts NHESP Program.
- **Protect land corridors** - Focus on creating “south to north” land protection corridors—dispersal and migratory wildlife routes through which terrestrial and aquatic flora and fauna will be able to move and adapt, as climate disturbance increasingly impacts biological processes and drives species north.<sup>66</sup>
- **Report rare species sightings** - Report rare species to Massachusetts NHESP and New Hampshire NHB to ensure the habitat of rare species is identified and protected.
- **Follow a comprehensive approach to large woody material** - Develop a comprehensive approach to large woody material (LWM) management in rivers and streams by working with stakeholders, including the Squan-a-Tissit Chapter of Trout Unlimited, local Conservation Commissions, recreational paddlers, the

---

65 MassWildlife is encouraging landowners to create young forest on their land to benefit wildlife. MassWildlife Habitat Specialists can provide technical advice and guidance to qualified landowners.

<https://www.mass.gov/news/masswildlife-can-help-landowners-create-young-forests>

66 Britta Timpane-Padgham et al., “A systematic review of ecological attributes that confer resilience to climate change in environmental restoration,” (PLOS, March 16, 2017), <https://doi.org/10.1371/journal.pone.0173812>.

Massachusetts Division of Fisheries and Wildlife, and others. A comprehensive approach allows for safe paddling, but also recognizes that LWD provides important ecological benefits, and should be left in place whenever possible.<sup>67</sup> The goal should be the judicious pruning of downed trees in rivers to provide for both recreational use and aquatic ecological habitat.<sup>68</sup>

- **Prepare for future land protection** - Ensure that if the South Post of Fort Devens is ever surplused that the land is permanently protected and/or becomes incorporated into the Oxbow National Wildlife Refuge (less the one hundred

<sup>67</sup> Large woody material (LWM) provides habitat, improves water quality, supports invertebrate life cycles, creates physical complexity and stabilizes banks and bed so there have been concerns about clearing such from the rivers. An excellent approach to LWM management can be found in “Recreation Enhancement of the Lamprey River: Final Report to the Lamprey River Wild and Scenic 2015 Small Grants Program,” [www.lampreyriver.org/UploadedFiles/Files/woody\\_obstacles\\_report.pdf](http://www.lampreyriver.org/UploadedFiles/Files/woody_obstacles_report.pdf)

<sup>68</sup> The “Trees, Paddlers, and Wildlife” guide produced by the Massachusetts Division of Ecological Restoration (DER) and the companion video “Trees, Paddlers and Wildlife” produced by the Appalachian Mountain Club and Massachusetts DER should be starting references for such efforts.

acres to Lancaster). Inform all current Boards of Selectman and Conservation Commissions in Lancaster and Harvard of this understanding.

### **GOAL A.3: Protect state-listed Blanding's turtles (threatened in Massachusetts and endangered in New Hampshire).**

**Objective: Protect existing turtle populations and help expand populations for the future.<sup>69</sup>**

- **Reduce turtle mortality in roads** - Determine road mortality “hot spots” and reduce such through public educational signage located at “turtle crossings.” Report Massachusetts road mortality at Linking Landscapes:  
[www.linkinlandscapes.info/turtle-roadkill-surveys.html](http://www.linkinlandscapes.info/turtle-roadkill-surveys.html)  
See [www.blandingsturtle.org/uploads/3/0/4/3/30433006/nebtwg\\_recreation.pdf](http://www.blandingsturtle.org/uploads/3/0/4/3/30433006/nebtwg_recreation.pdf)
- **Provide habitat** - Create turtle nesting habitat—a limiting factor—to encourage turtles to nest in areas that will not require them to cross roads. Work with MassWildlife and Massachusetts NHESP to evaluate prime habitat.
- **Protect vernal pools** - Defend integrity of specific vernal pools, which are vital Blanding’s turtle habitat, by prohibiting vernal pool (VP) modification. Encourage certification of potential vernal pools (PVPs) as appropriate. Certified Vernal Pools (CVP) are Outstanding Resource Waters. While VPs fall under habitat for Blanding’s, most Blanding’s visit VPs during the spring to feed on egg masses. Protecting VPs by certifying them is key, but buffers around and connections between all wetlands (ponds or scrub-shrub wetlands) and upland aestivating (dormancy) and nesting areas used by Blanding’s are critical. Submitting rare species reports to Massachusetts NHESP and New Hampshire NHB is key to protect habitat.
- **Follow forestry best practices** - Given that maintaining forested land in forest use is vital to conserving viable populations of Blanding’s turtles, follow

---

<sup>69</sup> Protecting Blanding’s turtle habitat will protect a wide variety of other species in the process.

“Massachusetts Forestry Conservation Management Practices for Blanding’s turtles.”<sup>70</sup>

- **Engage public in turtle protection** - Encourage continued public support and participation in the annual “Big Night” (first mass amphibian movement in early spring) activities as well as local turtle protection happenings.<sup>71</sup>
- **Work to expand habitat** - Work with landowners, Conservation Commissions, land trusts, and others to expand protected forest land and other appropriate habitat for Blanding’s turtles adjacent to areas with existing populations so that there will be areas for expanding populations to move into.
- **Spread a message to leave turtles alone** - Consider starting or expanding head-starting school-based or other turtle-rearing project with proper authorization. Educating everyone about the importance of leaving wildlife wild and not taking turtles home is important. Turtles live a long time, if they aren’t run over, and it is best for them to remain in the wild.
- **Raise awareness about turtles** - Conduct public education and raise awareness through signage and educational information to residents, businesses, developers, and contractors. Publish newspaper articles and press releases during migration; provide information for websites, mailings, and local cable access. Partner with groups like Devens Eco-Efficiency Center to help raise awareness (e.g., support Earth Day turtle crossing sign-making project and/or other initiatives).

#### **GOAL A.4: Protect and enhance coldwater fish resources.**

**Objective: Maintain existing populations of coldwater fish through actions that help mitigate thermal effects of a warming climate; maintain riparian forests; ensure baseflows provided by cold, clean groundwater discharges;**

---

70 See Massachusetts Forestry Conservation Management Practices for Blanding’s Turtles at [www.mass.gov/eea/docs/dfg/nhesp/regulatory-review/blandings-turtle-cmp.pdf](http://www.mass.gov/eea/docs/dfg/nhesp/regulatory-review/blandings-turtle-cmp.pdf).

71 Amphibian Alert: Each spring in Pepperell, volunteers provide safe passage for salamanders on their nocturnal breeding migration at [http://archive.boston.com/news/local/articles/2011/05/08/in\\_pepperell\\_volunteers\\_make\\_sure\\_salamanders\\_get\\_safe\\_passage/](http://archive.boston.com/news/local/articles/2011/05/08/in_pepperell_volunteers_make_sure_salamanders_get_safe_passage/).

**sustain diverse aquatic invertebrate populations; and prevent nonpoint source pollution, especially sedimentation into coldwater streams.**

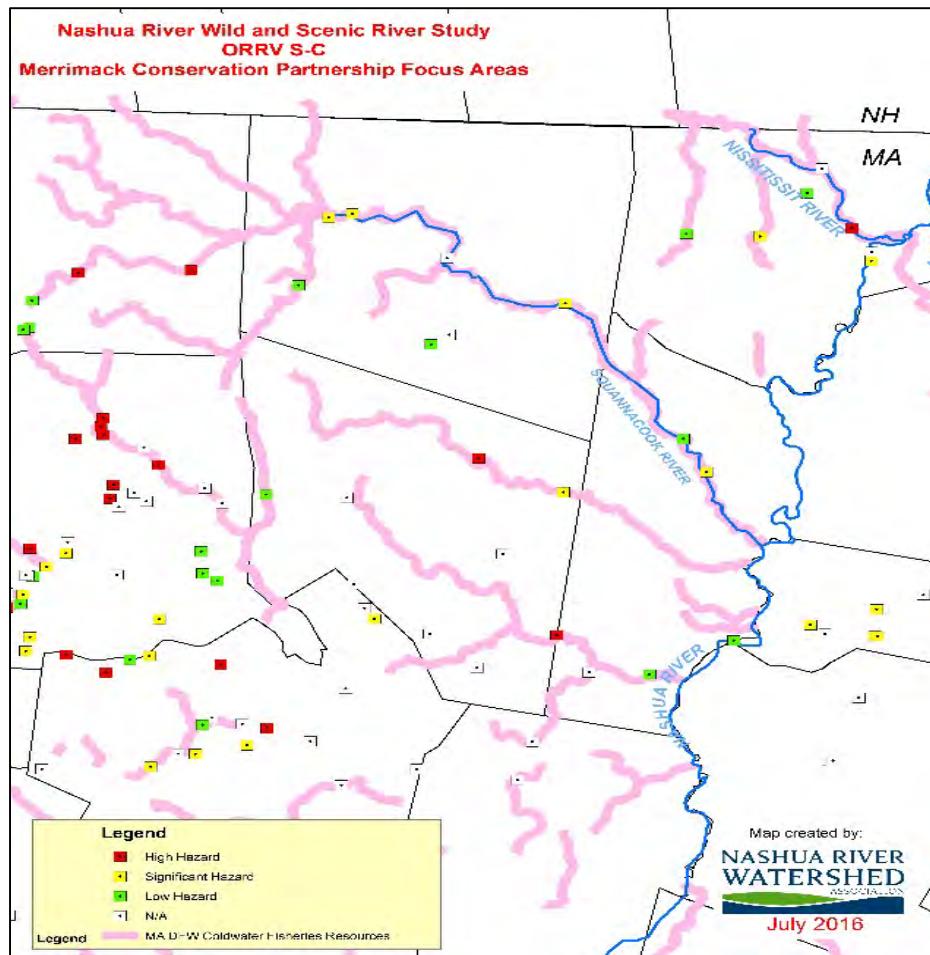

- **Raise awareness about streams** - Collaborate with anglers' organizations, aquatic biologists, naturalists, local school systems, and others to increase public awareness and appreciation of how headwater streams "work." Focus on baseflows and storm flows, the life of coldwater streams, the recreational value of coldwater fisheries, and the ways that individuals can both enjoy and contribute to sustaining these remarkable resources. Conduct outreach focused on engineers who develop stormwater systems for projects, municipal members of planning and conservation boards, and others whose decisions affect stormwater management and land use change.
- **Protect brooks** - Protect small, cold, headwater brooks, which are necessary for reproduction, rearing of juveniles, thermal refuge during periods of high temperatures, and as year-round habitat for some CFR species.<sup>72</sup>
- **Improve culverts and crossings** - Improve stream habitat by replacing and/or upgrading poorly designed culverts and other stream crossings.<sup>73</sup>

---

72 "It is imperative to maintain appropriate flow regimes and water levels (e.g., [streams are] reliant on groundwater inputs during much of the year; groundwater withdrawal or limited infiltration hampers this, impervious surfaces and drainage systems create higher than normal flows during rain events), access (e.g., dams, perched culverts, etc. cut off many kilometers of important habitat), and maintain suitable water temperatures (e.g., riparian vegetation provides shade among other important benefits to small brooks, runoff into streams from dark impervious surfaces is very warm): while accommodating demands for water supply, waste assimilation, commercial, industrial and agricultural uses. Small, coldwater brooks also buffer the temperature of the larger streams and rivers they flow into as well as some distance downstream from their confluence. The larger streams and rivers in the Nashua-Nissitissit-Squannacook complex could likely serve as overwintering habitat for trout and other coldwater species in their deeper pools." (Adam Kautza, Coldwater Fisheries Project Leader at MassWildlife, personal communication on June 1, 2017)

73 See "Restore or Maintain Watershed Connectivity to Provide Areas for Fish and Wildlife Passage and the Ability to Compensate for Increased Storm Events," pages 5-32 in *New Hampshire State Wildlife Action Plan*.

New or replacement bridges and culverts should ideally have openings which pass the bankfull width without constriction. Bridges and culverts should be designed to cross the river without creating channel approaches at an angle to structures. Such sharp angles can lead to undermining of fill materials and structural components. The historic channel migration pattern of the river should be considered when installing new or replacement crossing structures, and when constructing new roads, driveways, and buildings. Planned build-out for watershed communities and resultant channel enlargement (from increased percent imperviousness) should be considered when designing new or replacement bridges and crossing structures.

- **Preserve canopies** - Preserve forest canopies over coldwater fish resources to ensure streams remain shaded. Pay special attention to, and provide comments on, any proposed utility or natural gas pipeline construction that cross CFRs as well as

adjacent solar farms with an eye toward potential negative impacts resulting therefrom.

- **Protect water flow** - Maintain, protect, and enhance water flow regimes that support the needs of native river flora and fauna, while accommodating demands for water supply, waste assimilation, commercial, and industrial and agricultural uses.
- **Maintain riverbanks** - Conduct stream assessments to identify and repair man-made bank disturbance and/or erosion impacting natural structure and reducing riparian vegetative cover.
- **Study geology** - Conduct Geographical Information Systems (GIS) analysis of area's geology to help determine which headwaters might be prioritized for protection (given geological influences), in collaboration with state fisheries officials.
- **Address Data Gaps** - Support the NH Fish & Game's Coldwater Fisheries Program and Wildlife Action Plan to address data gaps in brook trout population and status.

### **GOAL A.5: Protect and Enhance Anadromous Fisheries.**

**Objective: Ensure ongoing and sustained populations of anadromous fishes by restoring and maintaining fish passage, spawning areas, and nursery habitat throughout the river system.**

- **Provide fish ladders** - Ensure adequate fish ladders are installed at hydropower facilities, and existing ladders are maintained for both up and downstream effective and efficient passage of river herring, American shad,<sup>74</sup> and American eel.<sup>75</sup>

---

<sup>74</sup> "American shad are in severe decline. In Massachusetts, shad have been extirpated or reduced to unsustainable populations in all rivers where they occurred, due to structures blocking spawning migrations, pollution of spawning grounds, changes in land and water use that reduce habitat, nonpoint source pollution, increased water withdrawals from spawning rivers, and overfishing. Climate change, predation, and bycatch in other fisheries also have led to population declines." (from Massachusetts Bays Program Official Website).

<sup>75</sup> US Fish and Wildlife Service, *Comprehensive Conservation Plan for Oxbow National Wildlife Refuge*, (January 2005) page 33.

- **Provide stream crossings** - Work with local and state highway officials to ensure that poorly designed culverts and other stream crossings are adequate for passage of migratory fishes year-round. Evaluate road and railroad crossings and prioritize poorly designed culverts for replacements using Best Management Practices (BMP) for Fish Passage as summarized described in the “Massachusetts Stream Crossing Handbook.”<sup>76</sup>
- **Reintroduce anadromous species** - Encourage state and federal agencies such as US Fish and Wildlife Service to reintroduce alewife and American shad to the Nashua River in the next few years, similar to the program ongoing since 2014 to reintroduce alewife in Lake Potanipo at the headwaters of the Nissitissit River in New Hampshire.<sup>77</sup> (See link: [www.wildlife.state.nh.us/fishing/anadromous-why-restore.html](http://www.wildlife.state.nh.us/fishing/anadromous-why-restore.html) ).

Possible call-out text box

*“Disturbances Over the Law Relative to the Killing of Salmon and Other Fishes, 1784*

*In 1781 the Great and General Court passed an act prohibiting "The Killing or destroying any salmon shad or alewives in the Merrimack River or any waters falling thereinto in this state, except on Tuesdays, Wednesdays and Thursdays, under a penalty of 2 lbs [pounds]"; and further- "That no person shall erect or build annually within the months of May, June, September and October, any dams or other obstructions across said steams, nor continue said mill-dams or other obstructions under a penalty of 20 pounds."*

*This act, according to tradition, because of its provisions for keeping the dams open during certain months of the year, was the cause of no little commotion in Raby [Brookline], where the project of damming the Nissitissit River at or below its outlet from the pond [Lake*

---

76 Department of Fish and Game, “Massachusetts Stream Crossing Handbook” (2<sup>nd</sup> editions, June 2012), [www.mass.gov/eea/docs/dfg/der/pdf/stream-crossings-handbook.pdf](http://www.mass.gov/eea/docs/dfg/der/pdf/stream-crossings-handbook.pdf)

77 “Alewife stocking has occurred for several years as part of a restoration project where the U.S. Fish & Wildlife Service and New Hampshire Fish & Game work to re-establish this native fish to our area’s waters. Downstream dam removal, and improved fishways at existing dams, will make it possible for the offspring of these stocked fish to return in future years to Lake Potanipo. These stocked adults will spawn in Lake Potanipo, and leave in a few weeks. Their young will grow in the lake all summer, and leave for the ocean during a fall high water event. It will then take 3-5 years for them to mature and return to reproduce themselves.” (Michael Bailey, USFWS, 2017, personal communication).

*Potanipo] was already being seriously considered. It divided the people into two factions. It was a question of "To dam or not to dam." One faction was opposed to the act, claiming that to build a dam across the river with the obligation of keeping it open during four months of the year, two of which, at least, were spring months when mill business was most active, was prohibitive to that extent that it reduced to a minimum the chances of making even a living profit in the mill business and therefore cut out all inducements for capital to invest in building mill-dams. The men who argued as above were, of course, the town's capitalists; many of them passing rich with a mortgaged farm and an income of five pounds a year. Thus it happened that they opposed the damming of the river and instead d---d the General Court for passing the law.*

*The other faction favored the act because, as they claimed, if the dams were not kept open during the spring months, the pond itself, as well as all the streams which flowed into it, would no longer furnish the inhabitants with their annual spring supply of brain food in the form of lamprey eels and alewives; a species of nutrition of which they openly hinted the brains of their opponents were sadly in need. This latter faction, therefore, was in favor of damming the river and obeying the law.*

*A few years later and while the foregoing act was still operative, a dam was built across the river at its outlet from the pond; and for many years after the seafish continued to make their annual migrations up and down the Nissitissit and its tributary streams. Indeed, that ancient "chestnut" of alewives crowding into brooks so thickly as to enable one to cross upon their backs from shore to shore, continued to be told of Douglass Brook in the village well into the nineteenth century." (from History of Brookline, New Hampshire, Edward Parker, 1914, pages 100-101).*

*Photo 3: Nissitissit River headwaters at Lake Potanipo, Ken Hartlage*

## **GOAL A.6: Sustain and Improve Populations of Freshwater Mussels.**

**Objective: Protect existing populations of freshwater mussels, and work toward restoration of extirpated populations, per Massachusetts NHESP recommendations.**

- **Improve habitat for endangered mussels** - Improve habitat condition for the recovery of extirpated and declining mussel populations. Freshwater mussels in Massachusetts and in New Hampshire are of special conservation interest as one of the most highly endangered animal groups in North America and are well represented at good sites such as in Nissitissit River, which need to be protected.
- **Avoid threat from sediment** - Protect freshwater mussels from construction projects, which have the potential for sediment release that could suffocate the mussels by insuring erosion control BMPs are in place for all work sites.<sup>78</sup>
- **Improve stream connectivity** - Work to improve stream connectivity throughout the watershed to allow passage of host fish species on which mussel populations depend. Ensure that construction involving road and railroad crossings includes installation of adequate culverts to allow year-round fish passage. Survey small dams to ensure that they do not impair the upstream passage of a wide array of potential host fish species (not just anadromous fishes).
- **Preserve habitat** - As with coldwater fisheries, work with communities, landowners, Conservation Commissions, fisheries managers, and state regulators to minimize non-point source pollution, including sedimentation and temperature changes. Maintain as much forested cover as possible in riparian and upland contributing areas to minimize thermal impacts. Manage stormwater to minimize surface flows of warmwater, to maintain year-round baseflows of cool groundwater, and to minimize changes in forested cover.

---

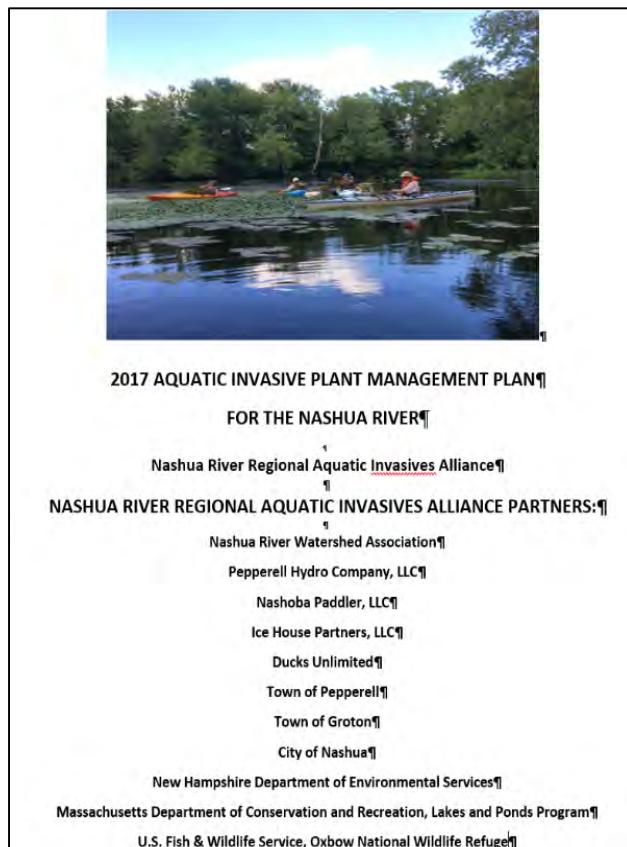

<sup>78</sup> While not all of the BMPs will be appropriate for or accepted by every municipality, they are meant to be a guideline of some of the technologies currently available. Also, see “New Hampshire Best Management Practices for Erosion Control on Timber Harvesting Operations” at [https://extension.unh.edu/resources/representation/Resource000247\\_Rep266.pdf](https://extension.unh.edu/resources/representation/Resource000247_Rep266.pdf).

- **Monitor for invasive mollusks** - Monitor streams to ensure that invasive mollusks do not become established, potentially competing with native species for food and altering the benthic substrate needed by mussels. In the event of invasive mollusks being documented, establish a targeted removal program promptly to attempt to prevent adverse effects on native species.

## GOAL A.7: Minimize the Effect of Non-Native Invasive Species.

### Objective: Control or diminish the prevalence of aquatic and terrestrial and/or riparian invasive plants and animals.

- **Monitor invasive species** - Monitor the presence of species that have the ability to thrive and spread aggressively outside their native range, both aquatic and land-based. Learn about methods for control and eradication. Communicate with and educate the public for prevention and control.

- **Follow stewardship practices** - Follow the recommendations in the *Aquatic Invasive Plant Management Plan for the Nashua River*,<sup>79</sup> notably water chestnut (*Trapa natans*) infestation in the Groton and Pepperell sections of the Nashua River, which has the potential to spread downstream.
- **Raise awareness about invasives** - Post signs warning of non-native invasive aquatics at launch sites, reminding boaters to check their boats for hitchhiking plants. Provide educational materials for lake and pond associations on invasive terrestrial and aquatic flora and fauna, including the proper cleaning boats and of motors to prevent transport and spread of invasives. Present programs and prepare articles for local media to educate the broader public about aquatic invasives, how to identify them, and things individuals can do to prevent the establishment and spread of invasives.
- **Monitor invasive aquatic weeds** - Where feasible as time and funding permit, conduct baseline mapping of aquatic invasive weeds along the rivers (other than in those sections already done in the Oxbow NWR); additionally, those areas previously mapped should be periodically revisited to determine if any invasive plant growth has occurred.
- **Follow through on local plan** - Ensure the completion of the Invasive Species Monitoring and Control Plan by Pepperell Hydro for the Pepperell Pond Impoundment.<sup>80</sup>
- **Incorporate controls in municipal processes** - Work with municipalities to incorporate invasive species control as part of the approval and permitting process for land development. Invasive species identification and management during

---

79 Nashua River Watershed Association for the Nashua River Regional Aquatic Invasives Alliance, “Aquatic Invasive Plant Management Plan for the Nashua River,” (2017).

80 Per Pepperell Hydro’s FERC license (P 12721-006), an Invasive Species Monitoring and Control Plan (ISMCP) is to be implemented by the Licensee. The objectives of the ISMCP will be: (1) to document the species composition of invasive plants from the upstream end of the Pepperell impoundment downstream to the tailrace (i.e., the project area); (2) to implement an early detection/rapid response program to identify and control new invasive species infestations within the Pepperell project area; (3) to conduct surveys and associated reporting of the project area’s infestation status on a five-year cycle; and (4) to identify potential means (regional programs) to maintain or reduce the existing infestations.

permitting, construction, and operations can help reduce the spread of invasives and support greater biodiversity along the river corridors.<sup>81</sup>

- **Evaluate control methods** - Attempt to control non-native, exotic invasives—such as purple loosestrife, for example—by releasing host-specific beetles: insects that feed only on this invasive plant and pose no threat to the wetland ecosystem. Evaluate results of such past efforts and if established that this is effective, expand beetle release program.<sup>82</sup>
- **Encourage native plantings** - Encourage native landscaping, at home and at businesses, to support wildlife ecology and to reduce escapes of potential new invasive species into the wild.
- **Enlist volunteers** - Sponsor hand-pulls of invasive species such as purple loosestrife, especially in areas where the populations of the plant are small. Annual pulling has been shown to be effective in controlling this species when started early after initial appearance of the plants.
- **Consider smothering methods** - Control of some riparian and wetland invasives such as Japanese bamboo (aka knotweed), purple loosestrife, and non-native common phragmites by smothering with black plastic or burlap has been found to be effective over the long term if the treatment is carried out consistently over time. Once established, Japanese knotweed becomes a major problem, and floodplains are highly susceptible; thus, attack it before it becomes well established anywhere along the river corridors. Initiate experimental efforts to document effectiveness of

---

81 See an example Devens: 974 CMR 3.04(8)(n)(g).

82 “Invasive or Overabundant Species: Common reed has invaded a portion of wetlands of Oxbow NWR. Planning to determine its rate of spread and the most effective means of control has been initiated. Purple loosestrife is another extremely invasive plant species which threatens portions of the wetland habitats of the refuge. No formal surveys to determine the rate of spread have been conducted. The refuge has released Galerucella sp. beetles and Hylobius transversovittatus weevils as biological control agents. The Galerucella beetles are leaf-eating beetles which feed on the leaves and the new shoot growth of purple loosestrife, weakening the plant until it eventually is removed or reduced. Hylobius tansversovittatus is a root-boring weevil that deposits its eggs in the lower stem of purple loosestrife plants. The hatched larvae feed on the root tissue, destroying the plant’s nutrient source for leaf development, which in turn leads to the destruction of the mature plant. Additional plant species that are considered to be invasive, and that require monitoring on the refuge include: spotted knapweed, glossy buckthorn, Asian bittersweet, and autumn olive.” From “Oxbow National Wildlife Refuge Comprehensive Conservation Plan” (2013).

this approach in the Nashua River basin and, if promising, promote such controls by watershed groups and river users.

- **Organize clean-up efforts** - Support biodiversity in riparian habitat by organizing river clean-up days with local volunteers to hand pull target common terrestrial non-native invasive species such as Japanese knotweed, Japanese barberry, Asian bittersweet, and glossy buckthorn. Consider the use of herbicides, if necessary, to control the spread of terrestrial invasives. Herbicides are only to be used where safe and appropriate, after obtaining the required approvals from state and local boards and committees.

## B: Water Quality and Quantity

**GOAL B.1: Maintain and improve our rivers' water quality so that it supports the needs of native wildlife, aquatic resources, and water supplies.**

**Objective: Collect data, make plans, and take actions that support improved water quality.**

- **Study water quality** - Ensure NRWA's volunteer, citizen-based water monitoring program continues and captures data from geographically representative sites. Collect streamflow and water quality data as needed to support the protection of these resources.
- **Address impaired waters** - Consider developing an approved Watershed-Based Plan for impaired sections of rivers in the designated reaches. Apply for federal Section 319 Clean Water Act grants to improve water quality.
- **Conserve land** - Conserve undeveloped and sensitive land within the area to limit impervious cover and mitigate the effects of urbanization<sup>83</sup>. Corridor protection

---

<sup>83</sup> Several key management challenges affect the ecological integrity of the river corridor. These include increasing development, invasive species, habitat fragmentation, water withdrawals, and stormwater, sediment, and nutrient runoff into the river. “The CFRs in this region suffer from the effects of excessive development and its associated issues (e.g., loss of riparian forest, dams/impoundments, perched culverts and other road crossings, impervious surfaces, water withdrawal, etc.).” Adam Kautza, Coldwater Fisheries Project Leader at MassWildlife, personal communication on June 26, 2016.

strategies that prevent or limit placement of infrastructure within the corridor will protect structures from future erosion and flood losses.<sup>84</sup>

- **Increase green canopy** - Increase street tree and urban/suburban forest canopy cover within developed areas of the watersheds to aid in stormwater quantity and quality management, while decreasing runoff temperatures. Also, promote the use of other green infrastructure techniques, such as vegetated roofs and walls in the built environment, to better manage runoff in the watersheds.
- **Protect drainage** - Protect and restore natural drainage patterns where feasible through stream daylighting and tributary restoration projects (for example, consider appropriate sections of Varnum Brook in Pepperell). Improve water quality by using low-impact development techniques to pre-treat runoff prior to discharging to any tributaries.
- **Practice bioretention** – Publicize the benefits of bioretention<sup>85</sup> areas and promote the use of these and other green infrastructure and/or low-impact development (LID) techniques for managing runoff from nearby farms and developed areas. Consider identifying a candidate site in the proposed designated area for installing a bioretention area to demonstrate its benefits and functions.
- **Review NPDES** - Review National Pollutant Discharge Elimination System<sup>86</sup> (NPDES) permits for municipal, industrial and private entities to ensure water quality standards can be maintained or achieved.

---

84 According to Vermont Department of Environmental Conservation: One of the primary objectives of river corridor planning is to identify the key flood and sediment attenuation areas, where human land uses may be in constant conflict with the channel evolution of particularly dynamic and sensitive stream reaches. Key attenuation reaches are prime candidates for the acquisition of river corridor conservation easements because they are critical to the capture and storage of water, sediment, nutrients, and organic material. Functioning attenuation reaches serve to reduce excess erosion, reduce the fine sediment and nutrient loading that otherwise impairs water quality, and retain the coarser sediment and organic debris important as cover habitats to aquatic organisms.

[http://dec.vermont.gov/sites/dec/files/wsm/rivers/docs/rv\\_RiverCorridorEasementGuide.pdf](http://dec.vermont.gov/sites/dec/files/wsm/rivers/docs/rv_RiverCorridorEasementGuide.pdf) (page 3).

85 Bioretention is the process in which contaminants and sedimentation are removed from stormwater runoff. Stormwater is collected into the treatment area, which consists of a grass buffer strip, sand bed, ponding area, organic layer or mulch layer, planting soil, and plants. Bioretention cells are depressed areas, generally about six inches, with specific soils and plants to help naturally attenuate and filter stormwater runoff used as infiltration filter. Plants used in the cells should tolerate wet and dry conditions.

86 NPDES is a permit program that controls water pollution by regulating point sources that discharge pollutants into waters of the United States as authorized by the federal Clean Water Act.

- **CSO notification** - Ensure stakeholders in designated downstream reaches from municipalities with Combined Sewer Overflows (CSOs) are notified of CSO incidents in a timely manner.
- **Participate in collaborations** - Participate in networking collaborations with upstream and downstream communities, as appropriate, to improve water quality, including regional stormwater collaboratives and wastewater utilities.
- **Promote the Rivers Sanctuary Act** - Review whether the 1975 Squannacook-Nissitissit Rivers Sanctuary Act, which was intended to protect the state-designated Massachusetts ORWs of these two rivers (and associated named tributaries in Shirley, Pepperell, Ashby and Townsend) from degradation by new discharges of pollution, is still being honored today. Work with towns to ensure compliance with the Act.

**NISSITISSIT RIVERS SANCTUARY.**

*enacted, etc., as follows:*

Chapter 132A of the General Laws is hereby amended by after section 16 the following section:—

**Section 17.** There is hereby established in the towns of Ashby, Pepperell, Shirley, Townsend and Lunenburg a river area to be known as the Squannacook and Nissitissit Rivers Sanctuary. Said Squannacook and Nissitissit Rivers shall be comprised of the waters of the Squannacook and its tributaries, to wit: Ash swamp, Ashby reservoir, Berry Hill brook, Bixby brook, Flat pond, Flat Pond bridge reservoir, Locke brook, Mason brook, Pearl Hill brook, Skin brook, Trap Fall brook, Trout brook, Walker brook, Witch brook with the exclusion of that section of the Squannacook river from the Hollingsworth and Vose dam in Groton located approximately North 42° 36' 45", West 10° 15' 30", on the U.S. Geological survey map Shirley quadrangle, confluence of the Nashua river; and the waters of the Lachance river and its tributaries to wit: Coon Tree pond, Coggeshall pond, Heald pond, Mine brook, Port Barrel pond, Park Brook, Stewart brook, Sucker brook, Wolf brook. After the effective date of this act, no new discharge of treated or untreated sewage or other wastewater will be permitted to be discharged to the Squannacook and Nissitissit Rivers Sanctuary. The purpose of this section, sewage shall mean the wastes and waste products or discharges from human beings, such as, wash water, laundry wastes and similar so-called domestic waters; wastewater shall mean sewage, liquid or waste products or discharges from human beings, such as, wash water, laundry wastes and similar so-called domestic wastes, and also sewage, liquid or water-carried wastes from industrial, commercial, municipal, private or other sources. Person shall mean any individual, association, partnership, corporation, company, business, organization, trust, estate, commonwealth or any political subdivision thereof, administrative agency, public or quasi-public corporation or any other legal entity or the legal representatives, agents and/or signees thereof. No person shall install or construct, or cause to be installed or constructed, any new outfall, drainage pipe, ditch, channel or conveyance to carry storm water runoff, either directly from any structure, parking lot, or storage yard, or than from a one or two-family residence and appurtenances and storage facilities, into the Squannacook and Nissitissit Rivers Sanctuary or any tributaries thereof until plans have been approved by the planning board and conservation commission of the affected town in which the pipe, ditch, channel or other conveyance is located. Said town may require the destruction of any structure or structures or treatment works if it deems necessary to prevent the pollution of the Squannacook and Nissitissit Rivers Sanctuary by matter carried by storm water runoff. The attorney general shall take such action as may be necessary from time to time to enforce the provisions of this section. The superior court shall have jurisdiction in equity to enforce the provisions of this section.

*Approved April 14, 1975.*

- **Review stormwater permits** - Review NPDES Permit renewals and work with towns and regional stormwater collaboratives to help meet NPDES permit requirements.<sup>87</sup>

**Table: Discharges at Wastewater Facilities**

Name of Wastewater Facility	Point of Discharge	Permitted Volume (mgd) <sup>1</sup> Average per month
Facilities Within Proposed Designated Reaches		
Ayer	Nashua	1.79
Groton School	Nashua	0.07
Devens	Groundwater <sup>2</sup>	4.69
Pepperell	Nashua	1.13
Hollingsworth & Vose	Squannacook	2.4
Facilities Upriver from Proposed Designated Reaches		
East Fitchburg	North Nashua	12.4
Leominster	North Nashua	9.3
Clinton (MWRA) <sup>3</sup>	South Nashua	3.01

1. Million gallons per day

2. Devens facility discharges to subsurface filter beds

3. MWRA: Massachusetts Water Resource Authority operates the Clinton facility

- **Promote best practices for wastewater treatment** - Consider advocating for Best Management Practices at wastewater treatment facilities to remove endocrine disrupting chemicals, pharmaceutical contaminants, and harmful household products as yet untreated in the waste stream. The community is encouraged to properly dispose of medications at “drop boxes” available at most police stations. Prescription medications, vitamins, and similar products should not be disposed of in toilets or sinks. Sewer treatment plants and septic systems are not designed to remove these products from waste streams, so they can contaminate water resources.

---

<sup>87</sup> The Municipal Separate Stormwater Sewer Systems (MS4) permit, which will regulate stormwater in more than 250 municipalities in Massachusetts, was scheduled to take effect on July 1, 2017, with the first action item for municipalities to comply due in September. The stay delays permit implementation until July 1, 2018 and it postpones the due date for communities to file their Notice of Intent as well. Under the MS4 permit, municipalities must develop, implement and enforce a stormwater management program that controls pollutants to the maximum extent practicable, protects water quality, and satisfies appropriate requirements of the federal Clean Water Act. The MS4 permit requires implementation of six minimum control measures. Updated permit requirements include the need to address identified water quality problems, including stormwater discharges to water bodies with approved total maximum daily loads for bacteria, phosphorus and nitrogen.

- **Practice continuous improvement for wastewater treatment** - Keep current on the performance of existing wastewater treatment facilities to assure the continued protection of water quality. As funding becomes available or is sought, promote upgrades to the maximum extent practicable of our water pollution control facilities whose effluent makes up a majority of the river's baseflow at certain low-flow times of the year.
- **Monitor for contaminant discharges** - Conduct additional Illicit Discharge Detection and Elimination (IDDE) monitoring in most impacted segments of the Nashua River basin to identify potential sources of pathogens and other contaminants. Note: While the towns in this Wild and Scenic River stewardship area themselves do not have any CSOs, upstream communities on the North Nashua River do have such, which impact our mainstem Nashua River towns. This is one of the Municipal Separate Stormwater Sewer Systems (MS4) elements that each municipality will be responsible to comply with under the new NPDES permit.

**Objective: Pursue opportunities for preventing or reducing the impact of non-point source pollution from various land use activities using Best Management Practices.<sup>88</sup>**

- **Plan for erosion and sediment control** - Work with municipalities to ensure erosion and sediment control plans are being prepared, implemented, monitored, enforced, and removed appropriately as part of all development projects within the watersheds.
- **Plan for pollutant spills** - Ensure towns (public works, fire, or police departments) have emergency plans for accidental pollutant spills and have equipment for such emergencies on hand.
- **Follow best practices for road salt and sand** - Work with local municipal Departments of Public Works (DPW), highway departments, and the Massachusetts and New Hampshire Departments of Transportation to promote Best Management

---

<sup>88</sup> While not all of the BMPs will be appropriate for or accepted by every municipality, they are meant to be a guideline of some of the technologies available today.

Practices that minimize road salt and sand runoff to wetlands, streams, and rivers.

Research alternatives to road salt, as towns are willing.

- **Encourage best practices for property owners** - Reduce pollution from landscaping chemicals and reduce water consumption. Provide advice to citizens on proper use of lawn chemicals to prevent over-treatment. Encourage riparian landowners through an education campaign to reduce runoff on their property, minimize impervious surfaces and minimize pesticide and fertilizer use. Many property owners have lawns right up to the edge of the rivers or wetlands. Encouraging adequately wide vegetated riparian buffers is key.<sup>89</sup>
- **Review potentially damaging land uses** - Review any potentially polluting land uses within one-quarter mile of rivers and their tributaries. Agricultural uses where plowed fields with no vegetated riparian buffers are left bare throughout the winter and spring can be especially damaging.
- **Control improper dumping** - Reinforce or create pet waste bylaws/ordinances—pooper-scooper laws—and restrictions on illegal dumping and eroded areas, such as at Groton Place “dog park” along the Nashua River.<sup>90</sup>  
[www.nashobavalleyvoice.com/groton\\_news/ci\\_18007525?source=rss](http://www.nashobavalleyvoice.com/groton_news/ci_18007525?source=rss)
- **Create green landscapes** - Encourage the creation of green infrastructure networks—systems of connected natural, constructed or restored landscape features—that help preserve ecosystem services.<sup>91</sup>

---

89 See “Living in Harmony with Streams: A Citizen’s Handbook to How Streams Work” (Friends of the Winooski River, 2012) at <https://winooskiriver.org/images/userfiles/files/Stream%20Guide%201-25-2012%20FINAL.pdf>.

90 “Animal sources of pathogens are both urban and rural in nature: pet droppings on municipal streets delivered by stormwater runoff, livestock wandering into waterways, and wildlife such as beaver and moose. Some communities are installing pet waste gathering stations in public parks. While contamination by native wildlife is impossible to control, contamination by livestock is not. A single cow produces approximately 5.4 billion fecal coliforms a day, and two cows allowed unrestricted access to a stream for 24 hours can contaminate as much water as the city of Keene, N.H., uses in one day. Currently, the state of New Hampshire do not require farmers to keep livestock from entering streams, although a number of federal programs provide grants for fencing and alternative water sources.” [http://crjc.org/pdffiles/Connecticut\\_River\\_Rec\\_Management\\_Plan-Web.pdf](http://crjc.org/pdffiles/Connecticut_River_Rec_Management_Plan-Web.pdf); page 11.

91 See: [www.devensec.com/development/Green\\_Infrastructure\\_Guidelines\\_Final\\_8-12-14.pdf](http://www.devensec.com/development/Green_Infrastructure_Guidelines_Final_8-12-14.pdf) for an example education and awareness tool.

- **Share stormwater resources** - Encourage towns to join regional stormwater collaboratives to share the resources necessary to meet stormwater management goals.
- **Consider water in land use planning** - Ensure that land use planning includes adequate water supply resources, stormwater drainage systems, and wastewater treatment systems (both onsite and centralized sewer treatment systems) as well as permanent and temporary soil stabilization techniques and groundcover for all disturbed areas.
- **Identify threats from septic systems** - Partner with towns to identify the degree of threat from potential faulty and/or illicitly discharging septic systems, which may result in bacterial and nutrient contamination of nearby streams and groundwater.

### **Objective: Preserve and protect important high- and medium-yield aquifers.**

- **Promote aquifer protection** - Promote extended aquifer protection through land use regulations and acquisition. As a major aquifer recharge area, the Nashua, Squannacook, and Nissitissit River valleys store floodwaters and precipitation in their numerous wetlands and sandy glacial soils.
- **Conserve water** - Actively promote water conservation. Encourage communities to consider mandatory conservation measures to augment volunteer efforts during droughts. Develop homeowner incentives to conserve water.
- **Encourage rainwater reuse** - Actively promote rainwater harvesting and reuse. Encourage communities to consider requirements for capture and storage of rainfall for non-potable water uses on development projects to help better manage stormwater runoff and reduce the use of potable water. Encourage all landowners in methods of returning water to the ground instead of running off the property, including the use of rain barrels and rain garden installation. (See Massachusetts

Drought Management Plan<sup>92</sup> and New Hampshire 2016 Drought Management Plan.<sup>93</sup>)

- **Follow best practices for water withdrawal** - Encourage towns with registered<sup>94</sup> (not permitted) water withdrawals to also follow best practices and conservation measures: e.g., 65 residential gallons per capita day (RGPCD), 10% unaccounted for water,<sup>95</sup> and Best Management Practices, such as leak detection, pricing, public education, etc.
- **Adhere to regulations for water withdrawal** - Ensure Massachusetts's Water Management Act regulations (310 CMR 36.00) are followed in the evaluation of new water withdrawals, and for requests for increased water withdrawals.<sup>96</sup>

**Table #: Nashua Basin Water Withdrawals (2017)**

Name	Registration* Volume (mgd)	Current Permit Volume (mgd)	Total Authorized Volume (mgd)
Ayer DPW Water Division	0.82	0.5	1.32

Epic Enterprises, Inc. (Ayer)	0	0.15	0.15

92 Massachusetts Drought Management Plan, <http://www.mass.gov/eea/docs/eea/wrc/droughtplan.pdf>.

93 See [www.des.nh.gov/organization/divisions/water/dam/drought/documents/drought-management-plan-for-web.pdf](http://www.des.nh.gov/organization/divisions/water/dam/drought/documents/drought-management-plan-for-web.pdf) and New Hampshire Drought Program link [www.des.nh.gov/organization/divisions/water/dam/drought/categories/overview.htm](http://www.des.nh.gov/organization/divisions/water/dam/drought/categories/overview.htm).

94 Registration Volume is the volume of water registered with the Massachusetts Department of Environmental Protection. Since 1988, persons planning to withdraw water from ground or surface sources for purposes in excess of an annual average of 100,000 gallons per day or 9 million gallons in any three-month period must apply for a Water Management Act Permit. Withdrawers with a Water Management Registration do not need a permit if they do not increase withdrawals over their registered volumes or add any new withdrawal points to their system.

95 Unaccounted-for water (UFW) represents the difference between "net production" (the volume of water delivered into a network) and "consumption" (the volume of water that can be accounted for by legitimate consumption, whether metered or not).

96 "...[P]roduction (water supply) wells can cause streamflow depletion by intercepting groundwater that would have discharged to nearby rivers, or inducing direct infiltration of river water to the well, causing low-flow issues." Jeffrey Barbaro, USGS, personal communication on October 5, 2017.

Name	Registration* Volume (mgd)	Current Permit Volume (mgd)	Total Authorized Volume (mgd)
Hollingsworth & Vose	2.42	0	2.42
International, Inc. (Bolton)	0.2	0.15	0.35

- **Preserve hydrology** - Work with Planning Boards, Town Engineers, Conservation Commissions and developers, and landowners to consider maintaining or restoring predevelopment hydrology in order to protect groundwater recharge capability. Appropriate techniques include limiting impervious surfaces, rainwater harvesting, the use of swales and other LID measures, and Best Management Practices that assist infiltration. Runoff from pre-development cannot increase post-development, which is why each town needs staff that is capable of interpreting stormwater calculations.
- **Protect floodplains and wetlands** - Maintain the ability of floodplains and wetlands to efficiently absorb water and protect the river from runoff related pollution. Assess floodplain and wetland mapping for the corridors and determine ways to improve it, coordinating with state and federal agencies. Consider conducting *fluvial* geomorphic assessments<sup>97</sup> of the three rivers beginning with locations that have historical flooding and bank erosion issues. Work with town boards to inform them of the importance of floodplains<sup>98</sup> for floodwater storage and to encourage protection of floodplains and wetlands when considering development proposals.

---

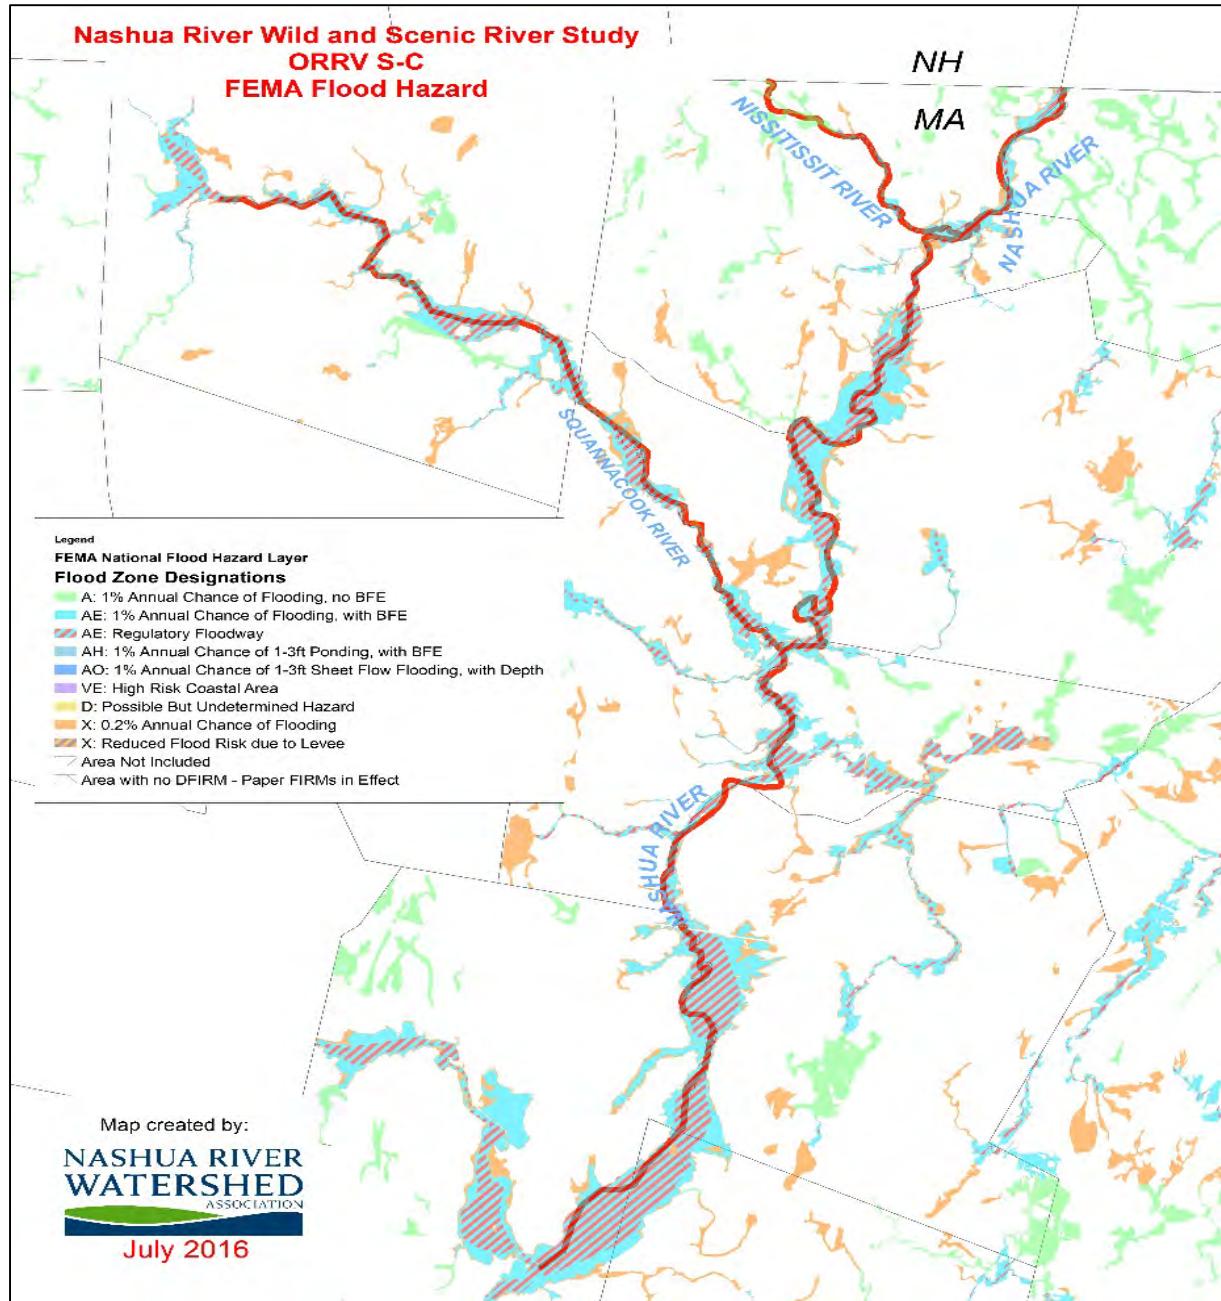

<sup>97</sup> Fluvial geomorphic assessments are studies of the physical condition of river systems. The assessments evaluate how, to what extent, and why river channels have become unstable. Causes ranging from major flood events to human activity are assessed. Data show that given the time and space, rivers eventually “evolve” to a channel form that is in equilibrium, or at balance, with the water and sediment inputs of their watersheds.

<sup>98</sup> It is important to recognize that rivers and floodplains need to operate as a connected system. Flooding is necessary to maintain the floodplain biological community and to relieve the erosive force of flood discharges by reducing the velocity of the water. Flooding and bankfull flows—the water level stage that just begins to spill out of the channel into the floodplain -- are also essential for maintaining the instream physical structure. These events scour out pools, clean coarser substrates (gravel, cobbles, and boulders) of fine sediment, and redistribute or introduce woody debris. (NWCC Technical Note 99–1, Stream Visual Assessment Protocol, 1998 [www.nrcs.usda.gov/Internet/FSE\\_DOCUMENTS/stelprdb1044776.pdf](http://www.nrcs.usda.gov/Internet/FSE_DOCUMENTS/stelprdb1044776.pdf).

- **Assess watershed geomorphology** - Consider conducting watershed geomorphic assessments that would enable knowledgeable decisions to guide the management of stable river corridors. Assessments will be useful in guiding land use, development, and infrastructure planning and design as well as flood hazard prevention. They can play an important role in the protection or restoration of the economic, aesthetic, and ecological values of river corridors. Through understanding of the relationships between watershed processes and human investments, we are able to make wise decisions about river corridor management.

(See [http://dec.vermont.gov/sites/dec/files/wsm/rivers/docs/rv\\_rc-protectmanagefactsheet.pdf](http://dec.vermont.gov/sites/dec/files/wsm/rivers/docs/rv_rc-protectmanagefactsheet.pdf), page 5)

## Objective: Educate public about the river ecology and ways to keep rivers healthy.

- **Engage town and state agencies** - Work with town DPW road crews and appropriate state Department of Transportation agencies who could help alert the public to the significance of Wild and Scenic Rivers. For example, signs could be posted at bridge crossings or other appropriate locations.

- **Raise awareness through events** - Sponsor local events to raise public understanding about native wildlife and the impacts of development patterns on habitat and ecosystem integrity. For example, provide Wild and Scenic River outreach information at community events, fairs, festivals, canoe races, fishing events, and other public gatherings.
- **Engage utility companies** - Work with private and public utility companies on creating and updating utility corridor management plans that recognize the importance of maintaining healthy wetlands, stream and river riparian buffers, and reducing the use of chemical pesticides in or near these sensitive areas.
- **Engage the public** - Engage with residents and others in the watershed on ecological issues, particularly with regard to recognizing that the streams, streambanks, and riparian areas, including riparian buffers and corridors, are sensitive places that might be conserved, restored, and protected.<sup>99</sup>
- **Pursue education opportunities** - Pursue opportunities to educate landowners, developers, and local land use boards about the causes of non-point source pollution, its potential impacts on water quality and instream resources, and methods—such as Best Management Practices—for reducing or eliminating it. Pursue opportunities to demonstrate the use of Best Management Practices in controlling non-point source pollution such as expanding riparian native vegetation buffers (to an ideal of 300 feet).<sup>100</sup>

---

99 The single most important natural system critical to maintaining the integrity of the entire Nashua River watershed is a forested riparian buffer.

100 Buffer Width: “There is not one generic buffer size which will keep the water clean, stabilize the bank, protect fish and wildlife, and satisfy human demands on the land. The minimum acceptable width is one that provides acceptable levels of all needed benefits at an acceptable cost for a particular site. The basic bare-bones buffer is generally 50 feet from the top of the bank. filter dissolved nutrients and pesticides from runoff a width of up to 100 feet or more may be necessary on steeper slopes and less permeable soils to allow runoff to soak in sufficiently.... on coldwater fisheries, the stream channel should be shaded completely. Studies show that that at least up to 100 feet, the wider the buffer, the healthier the aquatic food web. To protect against flood damage a smaller stream may require only a narrow width of trees or shrubs; a larger stream or river may require a buffer that covers a substantial portion of its flood plain. A 100-foot buffer will generally remove 60% or more of pollutants, depending on local conditions. It will also provide food, cover and breeding habitat for many kinds of wildlife but only fulfill few needs for others, such as travel cover.” (Connecticut River Joint Council Report, 1998).

Also see Eightmile River Wild and Scenic Study Committee, “*Riparian Buffer Zones: Functions and Recommended Widths*,” (April 2005).

## C: Habitat

### **GOAL C.1: Maintain and enhance high-quality riparian habitat.**

#### **Objective: Protect intact and functional riparian buffers.**

- **Protect vegetative buffers** - Work to maintain or expand riparian native vegetated buffers to maintain lower water temperatures. Note that clear, coldwater supplied by the Squannacook and Nissitissit Rivers to the Nashua River provides a refuge for temperature-sensitive fish in all three rivers.
- **Restore streambeds** - Restore streambeds impacted by road sand deposition and seek solutions to reduce future road sand and other sedimentation. Involve town DPWs and state Departments of Transportation as appropriate.
- **Consider riparian buffers in town plans** - Give high priority protection to riparian buffers. This can be reflected in each town's *Open Space and Recreation Plan* "Inventory of Lands of Conservation and Recreation Interest," as well as their land use and subdivision bylaws and regulations.

#### **Objective: Support protection of important wildlife habitat areas and migration corridors as identified and prioritized through habitat studies and assessments such as "Universal Stream Assessment."<sup>101</sup>**

- **Encourage land conservation easements and restrictions** - Educate and encourage landowners to consider Conservation Easements (CE) in New Hampshire—aka Conservation Restrictions (CR) in Massachusetts<sup>102</sup>—and the importance of maintenance and enforcement of these restrictions. Consider providing funding to budget-strapped local land trusts whose lack of capacity makes it difficult to do required annual monitoring of all CEs. Also, consider

---

<sup>101</sup> A Universal Stream Assessment is a survey of rivers and streams based on physical, chemical and biological data collected and analyzed using standardized field and laboratory methods. The goals are to determine the extent to which rivers and streams support a healthy biological condition and the extent of major stressors that affect them. The assessment supports a longer-term goal: to determine whether our rivers and streams are getting cleaner and how we might best invest in protecting and restoring them. ([www.epa.gov/national-aquatic-resource-surveys/what-national-rivers-and-streams-assessment](http://www.epa.gov/national-aquatic-resource-surveys/what-national-rivers-and-streams-assessment))

<sup>102</sup> Massachusetts Land Trust Coalition, Conserving Land in Your Community, [www.massland.org/conserving-land-your-community](http://www.massland.org/conserving-land-your-community).

training volunteers to conduct annual monitoring of CRs/CEs, such as is done by Sudbury Valley Trustees (see [www.svtweb.org/properties/stewardship#Coordinate](http://www.svtweb.org/properties/stewardship#Coordinate)).

- **Encourage current use programs** - Encourage conservation and the preservation of existing forest, farm, and recreational land. Increase the likelihood of permanent forestland protection by increasing the number of forest landowners enrolled in current use programs (Chapter 61, 61A and 61B in Massachusetts). These programs can be used by landowners who want to keep their land in open space but are not able or willing to execute a permanent conservation restriction/easement agreement.
- **Support deer population control** - Encourage state agencies to include hunting<sup>103</sup> as a technique to reduce overpopulations of deer, which can be ecologically destructive. For example, MassWildlife Management Areas, which are a draw for birders and other nature watchers, have a mission of prioritizing wildlife habitat.<sup>104</sup>

For more see Massachusetts Audubon Society’s “Nashua River Watershed Important Bird Area Site” at [www.massaudubon.org/our-conservation-work/wildlife-research-conservation/statewide-bird-monitoring/massachusetts-important-bird-areas-iba/important-bird-area-sites/nashua-river-watershed](http://www.massaudubon.org/our-conservation-work/wildlife-research-conservation/statewide-bird-monitoring/massachusetts-important-bird-areas-iba/important-bird-area-sites/nashua-river-watershed)

### **Objective: Protect and expand “Green Infrastructure” networks and linkages; protect and enhance connectivity through attention to dams, culverts, streambank modifications, and bottom alterations.**

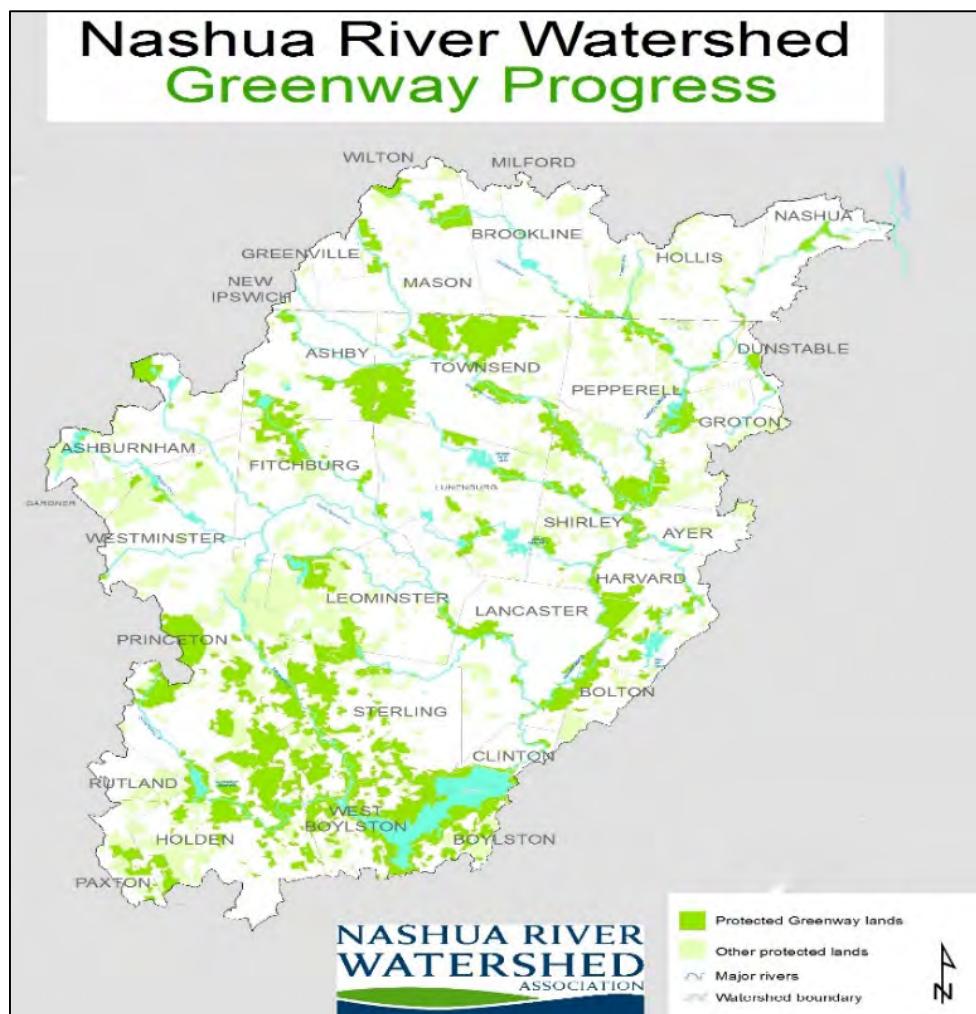

- **Connect greenways** - Increase land protection efforts to focus on connecting existing protected greenways (for example, between Bolton Flats WMA and Oxbow National

---

103 Nearly all Massachusetts Department of Fish and Game (DFG) properties are required to allow hunting, as the vast majority of their land purchases are made possible because of funds collected for hunting and fishing licenses.

104 Additionally, Massachusetts DFG has a policy of minimizing trails (see [www.mass.gov/eea/agencies/dfg/dfw/wildlife-habitat-conservation/wildlife-lands-trail-policy.html](http://www.mass.gov/eea/agencies/dfg/dfw/wildlife-habitat-conservation/wildlife-lands-trail-policy.html)).

Wildlife Refuge as well as a connector between Sucker Brook and Gulf Brook, and elsewhere).

Map 3: Nashua River Watershed Greenway Progress – NRWA, 2017

- **Support linear greenways** - Restore and sustain lands along all water bodies, including wetlands and their surrounding lands, as linear greenways for their natural resource values, as well as along all headwaters throughout the stewardship area, as opportunities arise.
- **Encourage voluntary land conservation** - Continue to assist and support private landowners and local land trusts in their voluntary land conservation measures that protect important riverfront—and watershed—lands. Encourage all land protection agencies to pursue the purchase (in fee or conservation easements) and, of course, through gifting of important river-related lands from willing sellers if parcels come on the

market and if funding is available. Give high protection priority to headwaters and tributaries of the rivers.

- **Explore multi-use opportunities** - Continue to look for connections to points of regional recreation and open space interest, such as the Oxbow National Wildlife Refuge, the Shirley Shaker Village, Fruitlands Museum, Ayer State Game Farm, and the Squannacook State Wildlife Management Area in Shirley, as well as connections to the Nashua River corridor, as stated in the *2008 Devens Open Space and Recreation Plan* in reference to its Multi-Use Trail Network Plan.

## **Objective: Minimize loss of valued habitat.**

- **Protect stream habitat** - Assist with protection of small, prioritized headwater streams that supply coldwater downstream.
- **Protect priority land habitat** - Assist local land trusts and Conservation Commissions to plan for priority land protection, especially of our three rivers and their tributaries.
- **Prevent erosion** - Minimize loss of habitat values coincident with land use practices that cause erosion.
- **Preserve the greenway buffer** - Work with involved parties to ensure that the Squannacook River greenway buffer—and its important turtle habitat—is not degraded by inadvertent misuse.
- **Encourage land management for wildlife habitat** - Work with and educate landowners to encourage continued and long-term management of the already protected open spaces in ways that are conducive to maintaining wildlife habitat.
- **Plan for future habitat protection** - Ensure that if the South Post of Fort Devens is ever surplused, the land is permanently protected and/or becomes incorporated into the Oxbow National Wildlife Refuge (less the one-hundred acres to Lancaster). Inform all current Boards of Selectman and Conservation Commission—in Lancaster and Harvard—of this understanding.

<b>!!SEC. 2831. TRANSFER OF JURISDICTION AND LAND CONVEYANCE, FORT DEVENS MILITARY RESERVATION, MASSACHUSETTS.!!</b>	
	(a) TRANSFER OF LAND FOR WILDLIFE REFUGE.--Subject to subsection (b), the Secretary of the Army shall transfer, without reimbursement, to the administrative jurisdiction of the Secretary of the Interior that portion of Fort Devens Military Reservation in the State of Massachusetts that is situated south of Massachusetts State Route 2, for inclusion in the Oxbow National Wildlife Refuge. The transfer shall be made as soon as possible after the date on which the property is determined to be excess to the needs of the Department of Defense.
	(b) LAND CONVEYANCE AUTHORIZED.--The Secretary of the Army shall convey to the Town of Lancaster, Massachusetts (in this section referred to as the "Town"), all right, title, and interest of the United States in and to a parcel of real property consisting of approximately 100 acres of the parcel available for transfer under subsection (a) and located adjacent to Massachusetts State Highway 70.
	(c) LEGAL DESCRIPTION.--(1) The exact acreage and legal description of the real property to be transferred under subsection (a) shall be determined by surveys that are mutually satisfactory to the Secretary of the Army and the Secretary of the Interior. The cost of such surveys shall be borne by the Secretary of the Interior.
	(2) The exact acreage and legal description of the real property to be conveyed under subsection (b) shall be determined by surveys that are mutually satisfactory to the Secretary of the Army, the Secretary of the Interior, and the Board of Selectman of the Town. The cost of such surveys shall be borne by the Town.
	(d) ADDITIONAL TERMS AND CONDITIONS.--The Secretary of the Army may require such additional terms and conditions in connection with the transfer and conveyance under this section as the Secretary of the Army considers appropriate to protect the interests of the United States.

- **Provide technical resources** - Provide technical assistance to municipalities, landowners, and private organizations seeking to protect and conserve floodplains, wetlands, forests, meadows, riparian vegetated buffers, and other fish and wildlife habitats.
- **Avoid in-stream crossings** - Prohibit all utility (gas and electric) in-stream crossings unless the project proposal can show that there is no other feasible alternative.
- **Design culverts and road crossings to allow wildlife passage** - Replacement of poorly designed culverts<sup>105</sup> and other road-crossing structures should follow the most up-to-date guidelines for stream crossing design, in order to reduce the incidence of destructive erosion, washouts, and scouring at stream crossings, and to allow for unimpeded wildlife passage under roads. Where possible, work in

105 “The biggest challenge with replacing culverts with a culvert that is bottomless, is cost. It is far less expensive to use a piece of high density polyethylene pipe (HDPE), which is why most DPW’s use this material.” (Paula Terrasi, personal communication on May 30, 2017)

Information on costs associated with maintaining/replacing culverts and potential funding sources should be distributed to towns, DPWs, and select boards. Incentives should be provided for removal or modification of infrastructure identified as barriers to ecosystem services integrity. (See *New Hampshire State Wildlife Action Plan*, pages 5-32.)

partnership with Massachusetts Division of Ecological Restoration and the New Hampshire agencies involved in the New Hampshire Stream Crossing Initiative.<sup>106</sup>

- **Design bridges and culverts to prevent channel disruption** - New or replacement bridges and culverts should ideally have openings that pass the bankfull width without constriction. Bridges and culverts should be designed to cross the river without creating channel approaches at an angle to structures. Such sharp angles can lead to undermining of fill materials and structural components. The historic channel migration pattern of the river and changing weather and precipitation patterns should be considered when installing new or replacement crossing structures, and when constructing new roads, driveways, and buildings. Planned build-out for watershed communities and resultant channel enlargement (from increased percent imperviousness) should be considered when designing new or replacement bridges and crossing structures.

- **Properly size stream crossings** - Work with and help town DPWs properly size stream crossings at bridges and culverts, and prioritize worst ones. “These and beaver deceivers<sup>107</sup> are often undersized for the size of the stream and result in

---

<sup>106</sup> New Hampshire Department of Environmental Services Stream Crossing Initiative, [www.des.nh.gov/organization/divisions/water/wetlands/streams\\_crossings.htm](http://www.des.nh.gov/organization/divisions/water/wetlands/streams_crossings.htm).

<sup>107</sup> Flow devices are man-made solutions to beaver-related flooding problems. Traditional solutions have involved the trapping and removal of all the beavers in an area. While this is sometimes necessary, it is typically a short-lived solution, as beaver populations have made a remarkable comeback in New England. Flow devices are

impounding of water and sediments upstream of the crossing, and which may limit habitat connectivity and passage of fish and other aquatic fauna.”<sup>108</sup>

- **Enhance in-stream habitat** - Reestablish and protect riparian zones and enhance in-stream habitat conditions. For example, locate beaver deceivers at poorly designed culverts that do not have fish passage.
- **Consider fish passage at dams** - Consider the effect of the two mainstem Nashua River dams, Pepperell and Ice House,<sup>109</sup> on fish passage. Establish and maintain adequate upstream and downstream fish passage facilities. Upstream fish and eel passage is required under the Federal Energy Regulatory Commission (FERC)

---

relatively cost-effective, low-maintenance solutions that regulate the water level of beaver dams and keep culverts open.

108 Massachusetts State Wildlife Action Plan, (2015) page 121; New Hampshire Wildlife Action Plan (2015) page 5-12)

109 “No anadromous fish are currently found in the Ice House Dam project area, and upstream and downstream passage facilities are not yet in place at the next downstream dam, the Pepperell Dam in Pepperell. Ice House Partners will be responsible for constructing, operating, maintaining, and evaluating upstream and downstream anadromous fish passage facilities when requested by the Massachusetts Division of Fish and Wildlife or the US Fish & Wildlife Service.” (Federal Energy Regulatory Commission FERC Order Granting Exemption from Licensing (5 Mw or less) Ice House Partners, Inc. Project No. 12769-000, March 31, 2008.

license for the Pepperell Dam.<sup>110</sup> Ice House Dam has eel passage for elvers going upstream.<sup>111</sup>

- **Evaluate obsolete dams** - Consider removal of obsolete dams on a case-by-case basis if determined to be appropriate, supported by local community, and consistent with state dam removal guidelines.

---

110 From Pepperell Hydro Settlement Agreement:

All upstream eel passage facilities shall be operational within three (3) years of license issuance.

Downstream Adult Eel Passage. To protect adult silver eels during outmigration, the Licensee shall either: (1) cease operating the Project from dusk to dawn from August 15 through November 30, annually. Or (2) operate a passage and protection system that meets the following criteria:

Downstream adult eel passage and protection measures or facilities shall be operational eight (8) years after juvenile eels are first documented using the upstream eel passage facilities. This timeframe may be adjusted by the Fisheries Agencies pursuant to the results of monitoring the upstream passage of juvenile Eels. Alternative passage and protection measures may be proposed by the Licensee, and considered by the Fisheries Agencies, if the Fisheries Agencies determine if sufficient data exist documenting their effectiveness.

Notwithstanding the foregoing, Massachusetts DFW has documented eels present in waterways upstream of the Project. Accordingly, in order to protect such eels during their outmigration, and prior to the provision of permanent adult eel passage facilities, the Licensee shall implement interim passage measures at the dam and/or forebay. Such interim passage measures shall be designed in consultation with, and require approval by, the Fisheries Agencies and (1) The licensee must install the interim downstream eel passage facility by August 1, 2018, and (2) shall operate until permanent passage facilities are implemented. Approvable interim passage systems may include either use of the existing forebay drain system or the installation of a siphon system in the same general forebay location.

a. Downstream Fish Passage

The Licensee shall construct, operate, maintain and evaluate the effectiveness of downstream fish bypass passage facilities for Targeted Migrants when the upstream fish passage system begins operation. Said passage facilities shall be operational the first downstream passage season after the beginning of upstream fish passage operation.

b. Upstream Fish Passage

Within three (3) years of license issuance, the Licensee shall develop and submit for Commission approval, functional design plans for upstream fish passage facilities. The upstream fish passage must be installed at the Project after a minimum of 5,000 river herring have successfully and volitionally passed through the Mine Falls' (FERC Project No. 3442) upstream fish passage system for a minimum of two (2) consecutive years (Trigger Level). Installation of the fish passage system shall occur within three (3) years of achieving this Trigger Level, but in no event shall the fish passage system be installed before the year 2026, regardless of the number of migrants passing the downstream Mine Falls Project. Should the Trigger Level occur before the year 2026, the Licensee shall provide interim upstream fish passage through the use of a commercial aquaculture fish pump with a temporary collection chamber installed at a location to be determined in consultation with the Fisheries Agencies. The Licensee shall seasonally operate the upstream fish passage facility in concert with upstream fish passage facilities located at the Mines Falls Project (i.e., same operational dates).

111 Liisa Marino, Grady Research, Personal communication on August 29, 2017.

## **GOAL C.2: Preserve, protect and improve wildlife habitat and migration corridors.**

**Objective: Promote completion of a permanently protected greenway along the rivers and their tributaries as the rivers and their banks provide key dispersal and migratory routes for wildlife, both aquatic and terrestrial.**

- **Conduct greenway inventories** - Coordinate with towns to complete a greenway inventory of protected and unprotected lands. Evaluate if lands thought to be protected are indeed fully “Article 97” protected<sup>112</sup> and are deed recorded.
- **Develop subdivision standards** - Assist town boards and work with municipal officials to develop subdivision standards that require proponents to devote a significant and sizeable portion of land (not including already-undevlopable wet or steep land) for open space conservation, and encourage mixed-use development and cluster zoning by-right bylaws.
- **Remove barriers to wildlife passage** - Consider removal of extraneous and abandoned chain link fencing where feasible on Devens and elsewhere, which creates a barrier for wildlife passage (examples of such fencing can be seen at and around the Nashua River by West Main Street; and, at the Nonacoicus Brook wetland on the North Post south of and adjacent to the Ayer Wastewater Treatment Plant and north of the rail line).

## **D: Municipalities and Land Use Planning Strategies**

### **GOAL D.1: Promote balanced growth, which preserves property values and protects and enhances the riparian resources for future generations.**

**Objective: Engage with landowners on these issues.**

- **Promote native vegetative buffers** - Educate and encourage landowners to plant and maintain native vegetative buffers in order to protect aquatic and riparian life by maintaining critical water temperatures, preventing soil erosion and sedimentation, stabilizing stream banks, slowing down runoff, and filtering

---

<sup>112</sup> See Massachusetts Executive Office of Energy and Environmental Affairs, Article 97 Land Disposition Policy at [www.mass.gov/eea/agencies/mepa/about-mepa/eea-policies/eea-article-97-land-disposition-policy.html](http://www.mass.gov/eea/agencies/mepa/about-mepa/eea-policies/eea-article-97-land-disposition-policy.html).

pollutants from stormwater runoff. Coordinate this effort through the local municipal Open Space and Recreational Plan committees and with Planning, Zoning, Conservation Commissions as well as Public Works, Engineering and Parks Departments.

### **Objective: Engage with municipalities and developers on these issues.**

- **Encourage low impact and green design** - Encourage communities to plan development so that natural and community resources are protected. Encourage local boards to require developers to use low-impact design and other green infrastructure elements/construction methods to minimize runoff.
- **Promote environmental compatibility in development projects** - Encourage towns to focus development in environmentally compatible areas through natural resource inventory assessment and mapping overlays<sup>113</sup> (geology, soils, wetlands and watercourses, habitat mapping, topography, microclimate, Massachusetts NHESP and New Hampshire Fish and Game). Encourage multi-town cooperation where appropriate. Review and comment on proposed state and private development projects to assure water quality will not be degraded. Maintain or restore predevelopment hydrology in order to protect groundwater recharge capability.
- **Pro-actively plan for redevelopment** - Be alert for opportunities to work with towns pro-actively to redevelop priority sites in an environmentally compatible and

The Joint Boards of Selectmen from Ayer, Harvard, Lancaster and Shirley said it best in their 1991 mission statement:

“We recognize the unique and valuable natural resources within the region. Future open space for scenic, natural resources, or recreational purposes is an integral part of our overall objectives. Natural resources, including wetlands, rivers, aquifers, soils and wildlife, are interconnected systems knowing no town borders. Development activities in one town can have dramatic impact on a neighboring town. Therefore, effective natural resource protection within reuse planning can only be achieved through multi-town cooperation.”

---

<sup>113</sup> See Ian McHarg's *Design with Nature*: [https://en.wikipedia.org/wiki/Ian\\_McHarg](https://en.wikipedia.org/wiki/Ian_McHarg).

creative way. For example, there may be opportunities to include river parks in plans for the reuse of former mill sites.

- **Promote wetland preservation** - Encourage *no net loss* of wetlands and where possible, re-establish, restore, and enhance wetlands as part of new development or renovation projects. Assess where this has already been done and is effective.
- **Share information on river protection** - Establish a clearinghouse of information on river protection techniques that have been used successfully in other areas.
- **Consider integrating a watershed plan** - Each town could consider integrating the recommendations of the last *NRWA Five-year Watershed Plan* and/or similar plans into its land use regulations and design standards.
- **Consider adopting this Stewardship Plan** - Request the Planning Boards of each participating Study Committee town to incorporate the *Nashua, Squannacook, and Nissitissit Rivers Stewardship Plan* into each of their Master Plans by reference or formal incorporation.
- **Foster watershed stewardship** - Develop a mechanism to monitor this Stewardship Plan, implement such a mechanism, and foster watershed stewardship.

## **GOAL D.2: To restore, protect, and enhance water quality and associated aquatic resources and water supplies.**

### **Objective: Take actions to protect and improve streambank and related conditions that negatively impact water quality.**

- **Prevent stream enrichment and contamination** - Prevent the accelerated enrichment of streams and contamination of waterways from runoff containing nutrients, pathogens, organics, heavy metals, and toxic substances.
- **Preserve natural vegetative canopy** - Educate and encourage landowners to maintain or restore a natural vegetative canopy along streams to ensure that mid-summer stream temperatures do not exceed tolerance limits of desirable aquatic organisms.
- **Minimize trash** - Maintain the stream or waterway free of litter, trash, and other debris by supporting the organization of river clean-up days sponsored by local

businesses, groups and/or organizations that share an interest and/or stake in the river. Also, support education and awareness campaigns on the impacts of trash by partnering with local schools to develop and disseminate information throughout the communities.

- **Minimize erosion and stream disturbance** - Minimize the disturbance of the streambed and prevent streambank erosion and, where practical, restore eroding streambanks to a natural or stable condition; for example, at the canoe launch parking lot at West Hollis Road/Brookline Street crossing of Nissitissit River.
- **Consider forming Stream Teams** - Consider putting together Stream Teams for the subject rivers and their tributaries to focus on river restoration and streambank stabilization and provide a venue for communication among stakeholders.

## ORRV #2 - RECREATIONAL AND SCENIC VALUES

*Photo: 4 Work of 1000 or NRWA archive*

River-related recreational pursuits are greatly valued in our area. This was not always so; in the 1960s, excessive water pollution and foul smells kept recreationalists far from the Nashua River corridor. The story of the remarkable recovery of the river is detailed as one of our Historic and Cultural values in ORRV#3 section. Today, high quality water supports water-based recreation as well as the enjoyment of numerous greenway trails by the banks of our rivers. The extraordinary amount of protected greenway—beautiful forests along vast stretches of the Nashua, Squannacook, and Nissitissit Rivers—give many paddlers and hikers a “sense of being in the wilderness” and assure them of rewarding scenic views in all directions.

**Hiking Adjacent Conserved Lands.** Among the many major riparian conservation lands (“open spaces”) are: Oxbow National Wildlife Refuge (1,667-acres with almost eight miles of Nashua River frontage),<sup>114</sup> Bolton Flats State Wildlife Management Area (~1,000 acres), Squannacook River State Wildlife Management Area (1,934 acres), Nissitissit River State Wildlife Management Area (625 acres), Townsend State Forest (3,082 acres), Nashua River Rail Trail (11 linear miles one-way), and J. Harry Rich State Forest (~500 acres). The J. Harry Rich State Forest was the first state-owned tree farm in the nation and the most intensively

---

<sup>114</sup> There are over 13 miles of trails connecting Devens trails and the Oxbow National Wildlife Refuge trails: these trails run along the Nashua River but also many tributaries.

managed forest acreage in New England according to Hugh Putnam, former chief forester for the New England Forestry Foundation.

Significantly, there are more than one thousand additional acres of locally owned land trust and municipal conservation properties, such as Groton Town Forest (~500 acres) along the river, which had originally been the site of the town's "Poor Farm". Furthermore, there are extensive conservation properties along important tributaries to our rivers. The Montachusett Regional Planning Commission (MRPC) has put considerable effort into creating an interactive web mapping application "MR Mapper" which has more than a dozen data layers including all existing formal trails (and trailhead parking) in six of our focus area towns. This valuable information is available on mobile devices for locational use in the field: see <https://mrmapper.mrpc.org>.

A fact contributing to the success of so much protected land in the focus area is the large number of varied organizations with different focuses working here to protect land, and often working together. These organizations range from federal US Fish and Wildlife Service (Oxbow NWR) to state (MA Department of Fish & Game/Division of Fisheries & Wildlife – Wildlife Management Areas), (MA Department of Conservation & Recreation – state forests & rail trails), (MA Department of Agricultural Resources – agricultural preservation restrictions), (New Hampshire Fish and Game Department) to municipal (Conservation Commissions, Town Forest Committees, Open Space Committees, etc.) and regional and local land trusts and conservation organizations (Beaver Brook Association, Bolton Land Trust, Dunstable Rural Land Trust, Groton Conservation Trust, Harvard Conservation Trust, Lancaster Land Trust, Mass Audubon, Nashoba Conservation Trust, Nashua River Watershed Association (coordinating US Forest Legacy Grants and facilitating protection by others), New England Forestry Foundation, Nichols-Smith Land Trust, Nissitissit River Land Trust, North County Land Trust, Piscataquog Land Conservancy, Society for the Protection of New Hampshire Forests, the Trustees of Reservations, the Trust for Public Land, and Townsend Land Trust) as well as others such as sportsmen's clubs, religious and educational institutions, MassDevelopment, and the Devens Enterprise Commission.

It is worth noting that Massachusetts currently has the second highest number of land trusts in the country after California. It is also the first state in the nation to have had a land trust, the Trustees of Reservations. The New England Forestry Foundation had its first headquarters in

Groton, Massachusetts: it was located there from its founding in 1944 until 2003. And, over fifty years ago in 1967, the Hollis, New Hampshire Conservation Commission – the first town in New Hampshire to have a conservation commission -- was already noting “the importance of ‘open-space rural character versus development,’ and stressed the importance of acquiring land, ‘preferably along a water course.’” (2014 Annual Report Hollis NH: 50 Years of Land Conservation: 1965 – 2015, page 127)

Beaver Brook Association is a non-profit nature center with over 2,200-acre conservation area in Hollis, Brookline, and Milford, New Hampshire. It takes its name from Beaver Brook, a tributary of the Nissitissit River, which is protected by the association’s vast undeveloped land holdings.

**Riparian Rail Trials for Biking, Roller-blading and Horseback Riding.** Many dozens of miles of trails that can be used for biking and horseback riding are located along these three rivers. Most prominently, the singularly popular Nashua River Rail Trail (NRRT), owned by the Massachusetts Department of Conservation and Recreation, which runs more than 11 miles from Ayer north to the Massachusetts-NH state line, travels parallel to the Nashua River for a considerable distance. User counts taken in 2008 indicate that more than one thousand people take advantage of the NRRT on a typical summer weekend and a 2008 estimate by the Massachusetts Department of Conservation and Recreation indicates over 382,000 visitations to the NRRT for that year. The number is estimated to have grown substantively over the decade.

Also, in development for more than a decade, a Squannacook River Rail Trail is scheduled to be constructed in 2018. Phase 1 will travel approximately four miles in close proximity to the Squannacook River from Groton to Townsend Center. Additionally, there is an abandoned rail bed turned walking trail along much of the Nissitissit River in Massachusetts in the Nissitissit River State Wildlife Management Area. And, in New Hampshire, the “2017 Brookline Sidewalk and Trail Development Plan” details possible opportunities to pursue, including linking the Potanipo Rail Trail from the Hollis border to Lake Potanipo.”<sup>115</sup>

---

<sup>115</sup> [www.brookline.nh.us/sites/brooklinenh/files/2017\\_sidewalk\\_trail\\_final\\_report.pdf](http://www.brookline.nh.us/sites/brooklinenh/files/2017_sidewalk_trail_final_report.pdf)

See page 5 for prioritization of the sidewalk/trail projects. See page 17 for a map. Projects #1, 5, and 6 all include either the Nissitissit River or rail trail connectivity.

**Boating.** The Nashua River for the most part flows relatively slowly, and so is generally appropriate for boaters, including beginners. A local canoe, kayak and stand-up paddle rental and outfitter, Nashoba Paddler, Inc.—an economically successful, family-owned business—on the Nashua River in West Groton rents boats to more than **8,000 different visitors each year:** their customers come from near and far. Nashoba Paddler also offers tours and a summer River Camp.

It is also possible to launch one's own car-top boat at over a dozen access points; several of these sites are boat ramps also suitable for trailered boats. (See listing of such in appendix below and on website.) The NRWA's *Canoe and Kayak Guide* 6<sup>th</sup> Edition,<sup>116</sup> updated and republished in 2017, is a greatly-in-demand, pocket-sized book that provides maps and

---

<sup>116</sup> See <http://nashuariverwatershed.org/component/content/article/12-recreation/433-nashua-river-paddling-guide.html>

descriptions for river outings on 72 miles of the Nashua and its main tributaries, including the Squannacook and Nissitissit Rivers. The guide also details access points and portages.

For Information call 978-597-6974  
Sponsored by Townsend Lions Club  
Proceeds Benefit  
TOWNSEND LIONS CHARITIES

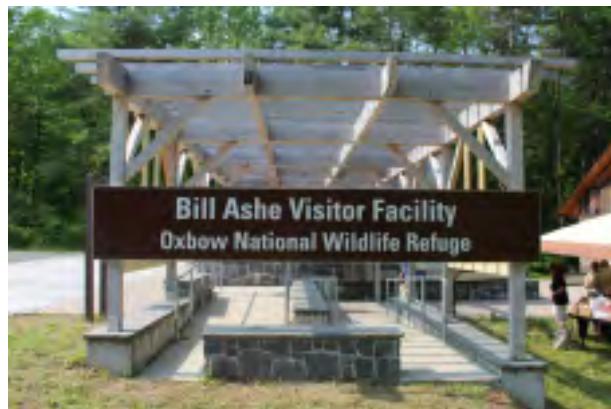

Additionally, the Townsend Lions Club holds an annual canoe race—the 34<sup>th</sup> such in 2017—on the Squannacook River and canoe races have been held on the Nashua River as well. The Groton School has always used the Nashua River for their crew team (~75 students each year participate in their rowing program)<sup>117</sup> with a 133-year history of rowing as of 2018.

The Groton Greenway Committee puts on an annual spring Greenway Festival at which a featured event is a cardboard boat race and there are often free boat rentals available provided by Nashoba Paddler. The Lancaster Friends of the Nashua River has held several river festivals at which Nashoba Paddler has also offered free boat rentals. Finally, the Boston, Worcester, and New Hampshire Appalachian Mountain Club chapters and other paddling groups (formal and informal such as meet-ups) organize numerous trips on the Nashua River and to some lesser extent on the Nissitissit River every year.

---

<sup>117</sup> Andy Anderson is rowing coach at the Groton School and a well-known American rower. He is a member of the National Rowing Hall of Fame and author of the best-selling rowing book *The Compleat Dr. Rowing*.

*Photo 4: Both NRWA Archive*

**Fishing.** The Nissitissit River and two of its tributaries, Sucker and Gulf Brooks, are stocked with brown, brook, and rainbow trout by MassWildlife. Unkety Brook, a tributary to the Nashua River, in Dunstable is also stocked. Some of these stocked trout are known to reproduce and persist in the coldwater sections of our rivers.

*Photo: 5 "Images of America: Groton"*

*Photo: 6 "Images of America: Lancaster"*

The Nissitissit and Squannacook Rivers are widely regarded as providing some of the best fly-fishing within reach of Boston, Nashua and Worcester area anglers, and have been for a long time. A 1973 Massachusetts Division of Fisheries and Wildlife (DFW) Creel Census found that almost 20,000 people spent more than 60,000 hours fishing on the Squannacook River. The NRWA's 1984 Squannacook River Protection Plan, says: "Although readily accessible from major roads and population centers, the Squannacook River is considered by DFW to be "one of the three best trout fishing streams in eastern Massachusetts's and is heavily stocked"<sup>118</sup>—the Nissitissit being one of the other three rivers—as it continues to be to this day. As noted

---

118 "Squannacook River Protection Plan," 1997.

earlier, the high water quality is in very large part attributable to high percentage of forest in their respective sub-watersheds.

The Squan-a-Tissit Chapter of Trout Unlimited is active in the watershed, engaging in projects such as constructing a universal access facility on the Squannacook River and assisting MassWildlife staff when they conduct electro-shocking and fish sampling. The Squan-a-Tissit Chapter has also adopted the Nissitissit River under the Massachusetts Adopt-A-Stream program. In the early 1990s, the Chapter was instrumental in the designation of the Henry Colombo area, a nearly two-mile reach of the river that extends from the New Hampshire border to the Prescott Street Bridge in Pepperell, as a Fly-fishing Only–Catch and Release area (Massachusetts's first so designated).

Chapter members have long been active in the Nashua River Watershed Association volunteer water quality monitoring program and the University of Massachusetts Acid Rain Monitoring Program. As part of the Trout Unlimited Brook Trout Initiative, the Squan-a-Tissit Chapter is currently conducting an assessment of the Nissitissit River and its tributaries to identify areas where restoration or protection efforts would most help protect the native brook trout populations. This assessment includes a reconnaissance survey of tributaries to identify reaches with native brook trout, a temperature survey of the Nissitissit and its tributaries, and an assessment of the connectivity of the tributaries to the mainstem.<sup>119</sup> (See <http://easternbrooktrout.org/news/newsletters/2008/ebtjv-northeast-april-2008>)

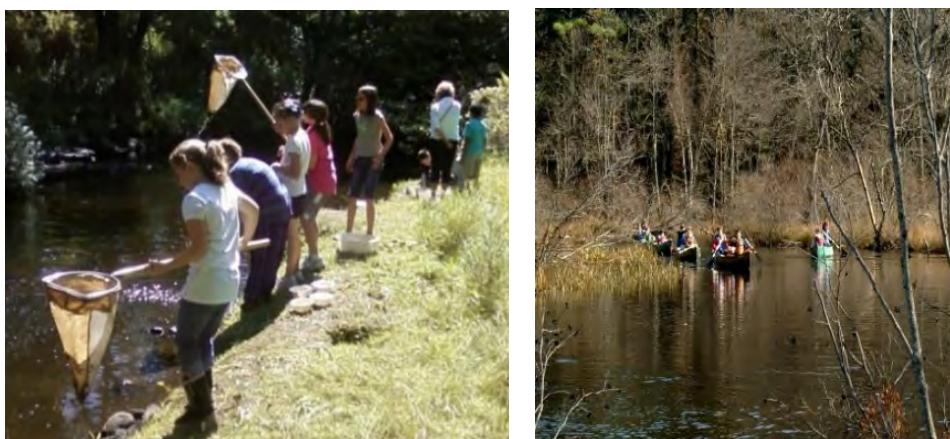

The warmwater sections of our rivers have also become popular for fishing since water quality improved. Over thirty different angling groups, such as Yankee Bassmasters and Freedom Bass, sponsor fishing tournaments in the Pepperell Pond impoundment of the Nashua River. Largemouth bass is found in the Nashua River, with many six pounders caught.

---

119 “Small, coldwater brooks also buffer the temperature of the larger streams and rivers they flow into as well as some distance downstream from their confluence. The larger streams and rivers in the Nashua-Nissitissit-Squannacook complex could likely serve as overwintering habitat for trout and other larger-bodied coldwater species in their deeper pools. To the angling community, these larger waters also provide more desirable fishing opportunities with chances to catch larger fish, both wild and stocked. It is imperative to protect the entire network of flowing waters to ensure continued integrity of coldwater fish assemblages and a robust recreational trout fishery.” (Personal communication with Adam Kautza, MassWildlife Coldwater Fisheries Project Leader, 6/1/17)

**Hunting.** The Pepperell Pond section of the Nashua River is a much-frequented waterfowl hunting location; Nashua River chapter of Ducks Unlimited is a proponent for hunting on this river segment. Several of our communities sportsmen's clubs are riparian landowners or abutters including: the Shirley Rod and Gun Club (~200 acres) situated on the Squannacook River,<sup>120</sup> and the Townsend Rod and Gun Club (~300 acres) and the South Fitchburg Hunting & Fishing Club (68 acres), which are located on tributaries to the Squannacook River.

**Environmental Education.** Additionally, the numerous open spaces and waterways provide environmental educational venues utilized by Beaver Brook Association, NRWA, and others. NRWA's on-water River Classroom® brings **approximately 3,000 students and adults every year** to the Nashua and Squannacook Rivers.<sup>121</sup> River Classroom®, conducted in partnership with Nashoba Paddler, has received the Massachusetts Executive Office of Environmental Affairs Secretary's Award for Excellence in Environmental Education.

---

<sup>120</sup> The beginning of the Squannacook River Wildlife Management Area was created when the Middlesex League of Sportsmen's Clubs purchased and donated 259 acres along the river to the state in 1966. On the lower Squannacook, over 160 acres has been dedicated to conservation by the Shirley Rod and Gun Club.

<sup>121</sup> For example, the school year 2016-2017 participant numbers are: 20 schools; 105 classes, 2,382 students, 1,177 chaperones (thus a total of 3,559 participants); and a total of 14,292 student hours for the school season. Since fall of 2001, a total of 382 different school have participated; 1,243 classes; 30,543 individual students; and 14,522 adult chaperones (thus a total of 45,065 participants). In terms of "student hours", it totals 183,258 student hours.

*Photo: 7 ALL - NRWA archives*

Additionally, there are four schools conveniently situated to use the Squannacook River as a nature study site: Spaulding Memorial Elementary School, Hawthorne Brook Middle School, North Middlesex Regional High School, and the Tarbell Elementary School. Venues such as the Williams Barn in Groton and the Bill Ashe Visitor Facility in the Oxbow National Wildlife Refuge in Devens offer indoor and outdoor classroom facilities. The Bill Ashe Visitor Center, dedicated in 2016, is sited by the Nashua River and has direct trail and water access for seasonal on-water environmental education opportunities.

**Scenic Views.** The Massachusetts legislature passed the Scenic and Recreational Rivers Act in 1971. “The driving motivation behind this program was to protect, preserve and acknowledge the rivers as significant recreational and scenic resources....[t]o safeguard water quality on and along the watercourses, maintain a healthy and safe environment, and enhance recreational opportunities for people.”<sup>122</sup>

---

122 From [www.umass.edu/greenway/Ma/Existing/MA-EG-nat.html](http://www.umass.edu/greenway/Ma/Existing/MA-EG-nat.html)

The Wright family holds a picnic along the Nashua River c. 1900. The men and women are dressed in Victorian-style clothing, and the image provides an interesting insight into leisure-time activities at the turn of the century. William Wright, shown in the center holding a shutter line, was an amateur photographer who was active from 1880 to 1920. Many of his

*Photo: 8 "Images of America"*

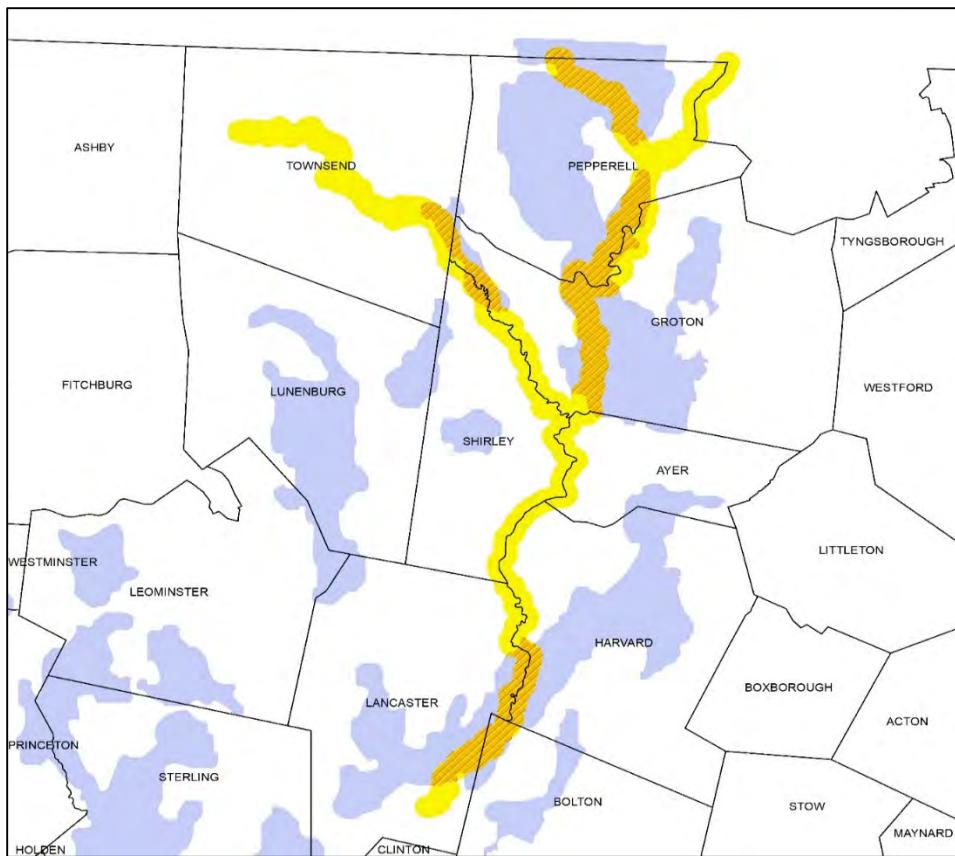

The Massachusetts Department of Environmental Management (now Department of Conservation and Recreation) Scenic Rivers Program prioritized the Nashua and Squannacook Rivers as meriting additional protection. In order to attain this Scenic River status, it was necessary for the governing bodies of the riverfront communities to approve the goals of the 1984 *Nashua River Greenway Management Plan*. Local approval was gained through a series of public meetings held by the Selectmen of each river town. To this day, these rivers' shorelines are remarkably undeveloped, and their scenery is exquisite.

One of the most famous views in central Massachusetts is of the Nashua River valley from Prospect Hill<sup>123</sup> at Fruitlands Museum – it looks much as it might have a century ago -- and is listed in the 1982 Massachusetts Scenic Landscape Inventory.

---

<sup>123</sup> Also, once called “Makamachekamuck Hill” prior to 1800 (see photo).

This Inventory,<sup>124</sup> which focused on the Commonwealth's very best landscapes, found that high scenic quality often coincides with, and depends on, the presence of a healthy natural environment, agriculture, historic features, and a lack of intensive, uncontrolled contemporary development. It advised: "*Existing or future efforts in these areas should be linked with a program for regional preservation*". Long stretches of the Squannacook and Nashua Rivers are rated as "distinctive scenic resources" in the Inventory.

Just above the confluence of the Nissitissit and Nashua Rivers is a scenic, historic attraction that many tourists photograph each year: Pepperell's "Chester Waterous Covered Bridge", which stands at the site of Blood's Fordway, where a bridge has spanned the river since 1742. (*Pepperell Open Space and Recreation Plan*, page 42-3) It is the only remaining covered bridge -- first erected in 1846 -- in Massachusetts east of the Connecticut River. ("Pepperell Greenway and Conservation Plan", NRWA, 1982, pg. 48) In Brookline, New Hampshire the

---

<sup>124</sup> The inventory was based on the subjective opinions of professionals guided by a series of objective factors. The entire Commonwealth was subject to the study, which identified the best landscapes greater than one square mile in area. Do note that there is no equivalent survey in New Hampshire.

Nissitissit River Covered Bridge is a 110-foot-long pedestrian covered footbridge that is a popular place to view the river near its headwaters at Lake Potanipo.

The Nashua, Squannacook, and Nissitissit Rivers abound with scenic vistas both from the rivers toward the shores and of the rivers from the land. This is evidenced by the number of people who recreate on or alongside the rivers, by the anecdotal comments they share with us, and by the comments found within the survey sections of each town's Open Space and Recreation Plans. The majority of residents feel that maintaining their towns' "rural character" is of pre-eminent importance and is worthy of their expending tax dollars toward preserving remaining undeveloped parcels of land. Scenic vistas play a strong role in "rural character." Most all the towns' Open Space and Recreation Plans also specifically enumerate riparian lands to be of penultimate importance.

The Nashua River Wild and Scenic Rivers Study Committee is nonetheless sensitive to the fact that evaluation of "scenic" resources can be a highly subjective and dependent on many aesthetic factors. Thus, several Committee members accepted, when offered, the opportunity to participate in a National Park Service training in "Visual Resource Assessment and Inventorying."<sup>125</sup> As a result, a Visual Resource Inventory was conducted on November 17, 2017. Four sites were completed out of the initial two dozen identified by the Study Committee. The Committee believes this will be a valuable exercise to continue.

---

125 The National Park Service Visual Resource Inventory (VRI) is a systematic process to identify scenic values for views within and extending beyond NPS units. (see [http://blmwyomingvisual.anl.gov/docs/NPS\\_VRI\\_Factsheet-08-2016.pdf](http://blmwyomingvisual.anl.gov/docs/NPS_VRI_Factsheet-08-2016.pdf))

## Some Key Findings on the Exemplary Status of Recreation and Scenic Features

- Eight thousand unique visitors use canoes & kayaks from Nashoba Paddler, LLC -- a locally owned outfitter – to explore the Nashua and Squannacook Rivers each year, in addition to the many who bring their own boats to over 20 access sites. Nashoba Paddler additionally offers tours and a summer River Camp.
- Award-winning NRWA River Classroom®, an on-water environmental education program, brings approximately three thousand students and adults every year to the Nashua and Squannacook Rivers.
- The Nissitissit and Squannacook Rivers are widely regarded as providing some of the best fly-fishing within reach of metro-Boston anglers.
- Over 30 bass fishing clubs hold tournaments on the Nashua River.
- The Groton School has always used the Nashua River for their crew team. The Groton Greenway Committee puts on an annual spring River Festival at which a featured event is a cardboard boat race. The Lions Club holds an annual canoe race on the Squannacook River.
- The eleven mile Nashua River Rail Trail (NRRT) paralleling the river for several miles receives more than one thousand users on any given summer weekend day, with people enjoying walking, running, bicycling, roller-blading, and horseback riding. A 2008 estimate by the Massachusetts Dept. of Conservation and Recreation indicates over 382,000 visitations to the NRRT for that year.
- The ~13,900 acres of permanently conserved lands that abut the rivers provide unparalleled opportunities for hiking and wildlife viewing, and, in many areas, hunting. The Nashua River is a prime area for hunting waterfowl in season.
- The Massachusetts Scenic Rivers Program prioritized the Nashua and Squannacook Rivers as scenic rivers in need of protection. The 1982 Massachusetts Scenic Landscape Inventory included long stretches of the Squannacook and Nashua Rivers

as “distinctive scenic resources” including Pepperell’s much-photographed “Chester Waterous Covered Bridge”.

- A significant factor in designating three contiguous Massachusetts ACEC's in the watershed is for the preservation of the scenic and recreational values of the Nashua River corridor.
- The many miles of permanently protected greenway along the rivers provide recreationists on shore or water with a serene and breathtakingly beautiful “wilderness” experience within an hour’s drive of three metropolitan cities with a combined population of over 3,000,000. (“Nissitissit River NH and MA - A Preliminary Report on Proposals to Preserve”, NH DRED, 1967).

## Recreation and Scenic Action Plan

### A: Protected Greenway Lands

**GOAL A.1: Promote continued protection of “temporarily protected” greenway lands (Chapter 61, 61A and 61B lands in Massachusetts; “Current Use” lands in New Hampshire).**

#### **Objective: Encourage municipalities to plan ahead.**

- **Inventory greenways** - Coordinate with towns to maintain an up-to-date greenway inventory of temporarily protected, permanently protected, and unprotected lands along the three rivers and their tributaries and headwaters. Encourage community officials to work with private, state, or federal partners and to apply for grants as appropriate to help finance selected land acquisitions as unprotected properties become available and the public supports their acquisition; similarly encourage officials to seek help with funding for stewardship improvements as appropriate.
- **Pursue opportunities** - Encourage Conservation Commissions and Boards of Selectmen to prioritize parcels in Chapter 61 and Current Use properties so that the towns could be ready to act quickly when rights of first refusal (which in Massachusetts afford 120 days to act) are triggered by sale.

**GOAL A.2: Promote additional permanently protected greenway lands and continued protection and completion of the “Nashua River Greenway” – the vision of a greenway along both sides of the rivers and their tributaries.**

#### **Objective: Provide proactive encouragement and support of greenway vision.**

- **Prepare for the future** - Ensure that if the Fort Devens South Post is ever surplused, the land is incorporated into the Oxbow National Wildlife Refuge as stipulated by 1996 Defense Authorization Act (excepting the 100-acres to the Town of Lancaster). Inform all current and incoming Boards of Selectmen and Conservation Commissions in Lancaster and Harvard of this legislation.
- **Support landowners and land trusts** - Continue to assist and support private landowners and local land trusts in their voluntary land conservation measures that protect important riverfront and associated watershed lands. Encourage all land buying agencies to pursue the purchase in fee or conservation easements or through gifting of

important river-related lands from willing sellers if parcels come on the market and if funding is available. The New Hampshire Legislature could provide adequate funding for Land and Community Heritage Investment Program (LCHIP) to help protect wildlife habitat and to keep land open for public recreation. Towns could take advantage of opportunities to protect land, especially on the riverfront, for public recreation and open space.

- **Identify connectors** - Identify greenway gaps and pay special attention to land protection efforts that provide “connectors,” especially including between Bolton Flats Wildlife Management Area and Oxbow National Wildlife Refuge, and the connection between Sucker Brook and Gulf Brook.<sup>126</sup>
- **Prioritize headwaters** - Give high protection priority to headwaters and tributaries of the three rivers, especially those of primary concern (as identified in municipal Open Space and Recreation Plans).

### **GOAL A.3: Support existing greenways**

#### **Objective: Maintain and restore greenways.**

- **Support healthy greenways** - Maintain the greenways in a healthy state.<sup>127</sup> Restore natural or man-made “degraded” lands,<sup>128</sup> particularly those visible from the rivers, for example by maintaining and expanding vegetated riparian buffer to ideal 300 feet from riverbank, where possible.

## **B: Fishing Use**

### **GOAL B.1: Ensure healthy ecosystems to support recreational fisheries.**

#### **Objective: Support both warm and coldwater fisheries.**

---

<sup>126</sup> As identified in the Massachusetts Audubon Society, “Focus Areas for Wildlife Habitat Protection in the Nashua River Watershed”, September 2000.

<sup>127</sup> Greenways are considered “healthy” when they serve their function as important ecological tools for the protection and enhancement of the natural environment. They improve water quality by establishing buffers along waterways and providing habitat. These buffers serve as natural filters, trapping stormwater pollutants from urban runoff, eroding areas, lawns and agricultural lands.

<sup>128</sup> “Land degradation is a process in which the value of the biophysical environment is affected by a combination of human-induced processes acting upon the land. It is viewed as any change or disturbance to the land perceived to be deleterious or undesirable.” (Wikipedia)

- **Protect riparian land** - Keep riparian forests intact so that their shade helps keep water temperature cool, which holds more dissolved oxygen than warmwater. Support and promote pavement reduction strategies within watersheds (narrower roads, porous pavements and surfaces that absorb runoff) to reduce stormwater runoff and water temperatures through education and awareness and changing of local subdivision and development codes. Reduce impervious surfaces when and wherever possible.
- **Protect water flow** - Maintain, protect and enhance water flow regimes that support needs of native river fauna, while accommodating demands for water supply, waste assimilation, commercial, industrial and agricultural uses. (In Biodiversity section above see Goal #4 Protect and enhance coldwater fish resources, on page 41 for more information.)
- **Support native fish** - Work with local, state and federal partners to keep healthy populations of native brook trout and other native sport fish for recreational fishing in the Squannacook and Nissitissit Rivers. One notable example of this is the work of the Squann-A-Tissit chapter of Trout Unlimited<sup>129</sup> to conduct an assessment of these rivers and to identify areas where restoration or protection efforts would be most helpful. Set up a training to learn how to conduct stream crossings (or aquatic connectivity<sup>130</sup>) surveying as needed.
- **Support fish passage at dams** - Consider the effect of the two Nashua River dams (in Massachusetts) – Pepperell and Ice House -- on fish passage. Support establishing and/or maintaining adequate upstream and downstream fish passage facilities. Comment on updated fish passage designs as they come up for review.<sup>131</sup>
- **Support recreational uses** - Help facilitate the continued use of the Nashua River in the “Pepperell Pond” area for bass fishing and bass fishing tournaments, notably by keeping

---

129 <https://squamatissit.org>

130 [https://streamcontinuity.org/aquatic\\_connectivity/index.htm](https://streamcontinuity.org/aquatic_connectivity/index.htm)

131 Note: Fish passage is a requirement of the FERC license and included in the schedule for “required” items to be completed for the Pepperell Hydro Dam. Fish passage will require strict review and approval by Massachusetts NHESP for the species of fish that could potentially pass through the dam area (see footnote # xx).

aquatic invasives (primarily, water chestnut) to a threshold below that which may impede boating.

*Photo 5: Water chestnuts in Pepperell Pond by Will Stevenson*

- **Balance multiple uses** - Promote dialogue regarding balancing multi-uses and avoidance of over-use resulting from increased public exposure on all three rivers in order to reduce potential conflicts.<sup>132</sup>
- **Promote responsible angling** - Educate and encourage anglers about proper disposal of lures, weights and other fishing equipment including monofilament line.

## C: Boating Use

### GOAL C.1: Preserve and enhance opportunities for boating.

#### Objective: Provide and maintain public boating access.

- **Maintain existing access for boaters** - Maintain the current appropriate public access sites for canoe and kayak users.

---

132 Note: The Missisquoi and Trout Rivers, Vermont's only Wild and Scenic River, answered the Frequently Asked Question

Will designation result in increased tourism or recreational use of the rivers? Not significantly. Tourism and recreational use on other rivers in the Wild and Scenic System have not seen dramatic increases in either tourism or recreational use attributed to Wild and Scenic designation. The degree to which such traffic increases largely depends on the extent to which the riverfront communities choose to promote Wild and Scenic designation.

[https://docs.wixstatic.com/ugd/7dcf17\\_83502e6926c84f05803f574a7ebec36b.pdf](https://docs.wixstatic.com/ugd/7dcf17_83502e6926c84f05803f574a7ebec36b.pdf)

- **Facilitate private access** - Secure continued public use through formal agreements with private landowners at informal boat launches regularly used by the public.
- **Support new access points** - Support creation of additional appropriate public access sites for canoe and kayak users, including those planned for the Pepperell Dam.<sup>133</sup>
- **Involve Public Access Board** - Identify appropriate areas for additional car-top public access utilizing the Massachusetts Public Access Board (PAB) staff and criteria<sup>134</sup> for potential car-top sites, if determined that such are needed.
- **Set site standards** - When new river access sites are desired, first develop criteria for siting such riverside public recreation areas.
- **Support handicapped access** - Support development of appropriate handicapped accessible sites.
- **Consider boat access with road projects** - Consider requiring provision for appropriate public access when bridges or culverts (especially on state roads) are upgraded.
- **Support water-based recreation** - Encourage the planning of water-based recreational opportunities. Encourage “blue (water) trails”<sup>135</sup> and their canoe access sites, where appropriate (e.g., Pellechia launch site).
- **Improve parking and signage** - Encourage adequate parking and signage at existing and new sites, notably at Petapawag launch site.
- **Improve boating passage** - Improve rivers for safe boating passage given large woody material obstructions while maintaining habitat by obtaining input and state approvals: from Massachusetts Natural Heritage & Endangered Species Program (MA NHESP) and Massachusetts Division of Fisheries and Wildlife.<sup>136</sup>

---

133 Pepperell Hydro, LLC. Recreation Plan for Pepperell Hydroelectric Project, prepared by Kleinschmidt, June 2017.

134 PAB’s criteria are: site must be publicly owned; demonstrated recreational need for the project; safe access into and out of the water; potential for adequate parking; a responsive municipal managing authority to maintain the site; and, consistency with the mission of the Massachusetts Division of Fish and Wildlife.

135 A recently created and close-by “blue trail” is on the North Nashua River in Lancaster Massachusetts.

136 Consult MassWildlife’s “Trees, Paddlers and Wildlife-Safeguarding Ecological and Recreational Values on the River” and/or New Hampshire DES’s Fact sheet “Managing Large Woody Material in Rivers and Streams”. <https://www.des.nh.gov/organization/commissioner/pip/factsheets/rl/documents/rl-21.pdf>. Here a key take-away

is: "If the large woody material is not a threat to human health, human safety, or river integrity: Let the Sleeping Log Lie." Large woody material provides habitat, improves water quality, supports invertebrate life cycles, creates physical complexity and stabilizes banks and bed so there have been concerns about clearing such from the rivers.

**ENVIRONMENTAL  
Fact Sheet**

Hazen Drive, Concord, New Hampshire 03301 • (603) 271-3503 • [www.des.nh.gov](http://www.des.nh.gov)

WD-R&L-21 2015

**Managing Large Woody Material in Rivers and Streams**

Large woody material, referred to in this document as LWM, is an essential part of life for rivers and streams. The end of life for a riverside tree is a source of nutrients for the diverse species living in the river ecosystem. River and stream habitat is preserved when the natural cycle of disturbance deposits LWM in a particular location within its corridor. Development of floodplains and property along waterways requires informed decisions and proactive stewardship with regard to preserving river health. One way we can help preserve river health is by giving streams and rivers a chance to preserve themselves when appropriate, without human interference. We can do this by not disturbing LWM in a river or stream. Removing LWM from a river or stream should only be performed if it poses an imminent threat to human health, human safety, river integrity or public infrastructure, e.g., a blocked stream crossing.

**Ecological Importance of Large Woody Material**

- **Provides Habitat:** LWM provides fish with shelter from high velocity flows, creating habitat for spawning, nurseries and foraging. These calmer glide and pool areas are ideal for fish to take refuge from predators and often serve as markers for migratory fish. Microbial life in the river, the crucial base of the aquatic food web, uses LWM as a colony habitat. In low flows, LWM provides twisted surfaces and hollows for these tiny organisms to proliferate, waiting to be released to the river as food for aquatic invertebrates and fish.
- **Improves Water Quality:** The presence of LWM in a river or stream provides surface area for water to flow over and around, increasing oxygenation of the water, which is vital for supporting aquatic life. LWM crevices and twisted branches serve as a bench for collecting silt, which increases the aeration in the river and assists in decreasing silt in gravel beds and river bottoms. The LWM's capacity to retain sediments and nutrients (phosphorus) reduces the potential for downstream water quality degradation from nutrient and sediment overloads.
- **Supports Invertebrate Life Cycles:** A log or limb protruding from a river or stream provides an excellent surface for many aquatic invertebrates such as mayflies and stoneflies to emerge from their river juvenile life stage to their terrestrial adult life stage. Some juvenile and adult aquatic insects rely on LWM as a source of nutrients and shelter during their life cycles. LWM is an excellent leaf and organic matter trap, which establishes ideal habitat for aquatic invertebrates.
- **Creates Physical Complexity:** When LWM is introduced into the river system, it alters the water flow, resulting in formations such as deep pools and rushing riffles. This increase in physical habitat variety increases the diversity of plants and animals that can populate the river. Biological diversity is essential in maintaining a healthy river ecosystem.

- **Evaluate woody debris** - Utilize a recreational and ecological evaluation documentation process to consider alteration of woody debris blocking boat passage under summer conditions similar to that used in 2015 by the Lamprey River Watershed Association.  
[www.lampreyyriver.org/UploadedFiles/Files/woody\\_obstacles\\_report.pdf](http://www.lampreyyriver.org/UploadedFiles/Files/woody_obstacles_report.pdf)
- **Maintain stream flows** - Maintain stream flow to enhance recreational and scenic qualities, while accommodating demands for water supply, waste assimilation, commercial, industrial and agricultural uses.
- **Regard speed limits** - Re-evaluate appropriate speed limits for the Pepperell Pond area of the Nashua River. Speeding motorboats can conflict with non-motorized uses on the river and can cause bank erosion due to large wakes. Post speed limits as appropriate (see [www.mass.gov/orgs/boat-and-recreation-vehicle-safety-bureau](http://www.mass.gov/orgs/boat-and-recreation-vehicle-safety-bureau) ).
- **Encourage clean boating** - Educate boaters to make sure boat hulls are clean before putting in as a way to limit the spread of aquatic invasive “hitchhikers” (see

<http://stopaquatic hitchhikers.org/>). Keep aquatic invasives to a threshold below that which may impede boating, for example at Pepperell Pond).

- **Publicize canoe guide** - Publicize NRWA's 2017 Canoe & Kayak Guide to encourage boaters to select trips compatible with their skill level. Update as appropriate. Consider smartphone app of this guide.
- **Work with paddling groups** - Interface and coordinate with regional paddling groups such as the Boston, Worcester and New Hampshire Appalachian Mountain Club (AMC) chapters, which organize numerous trips on the Nashua River and occasionally the Squannacook and Nissitissit Rivers.

## D: Swimming Use

### GOAL D.1: Provide opportunities for safe swimming in our rivers.

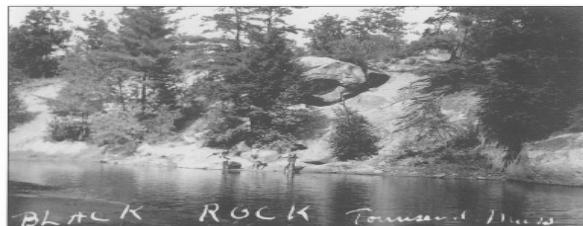

#### Objective: Be attentive to both river and riverbank conditions in evaluation of swimming opportunities.

- **Confront bacterial pollution** - Look for opportunities to reduce or eliminate sources of bacterial contamination/ pollution so that swimming is safe in the three rivers (i.e., stormwater controls) where appropriate and where sanctioned. Determine such possible non-point pollution sources through monthly water quality sampling/monitoring, or more frequent targeted sampling if funding allows.
- **Provide health warnings** - Educate public about public health threats regarding swimming within several days after intensive rainstorms. Alert the public through social media when bacteria levels at water monitoring sites have been exceeded for safe swimming or boating (primary and secondary contact recreation, respectively).
- **Consider a warning system** - Consider designing an on-line regularly updated “flagging” system to alert swimmers of any immediate water quality threats that would make primary contact with the water unadvisable in those public areas most frequently used for swimming.
- **Monitor and address high use areas** - Monitor most heavily used swimming areas to minimize or repair erosion problems on steep sandy banks (i.e., notably at Black Rock in

Townsend and Bertozzi Conservation Area in West Groton) where appropriate and where sanctioned. Guide pedestrian access to such sites onto paths that are least destructive.

Swimming in the gristmill canal was a bright feature of life in Townsend Harbor. When the leatherboard mill closed for vacation, neighborhood volunteers would drain the water from the canal and then clean it, using rakes, shovels, and pails attached to ropes in order to clear out the debris; children could then safely play in the canal. This photograph was taken in the 1950s. (Courtesy of Carol Wright.)

Local legends abound about Black Rock and the Native Americans passing through Townsend before the 18th century. According to one legend, the underside of Black Rock got its color from cooking fires built by the Native Americans. Legends aside, Black Rock has been a popular gathering place for generations of swimmers and picnickers.

Two boys, Clarence Morse (left) and Rouy Cowdrey, sit at Black Rock in the early 20th century. Children of every generation have spent time there. After 1932, students at Spaulding Memorial School would walk down to the river, hang their clothes on nearby tree branches, and swim.

- **Conduct public outreach** - Increase public access to the rivers where appropriate and where sanctioned while protecting the riparian integrity and the surrounding river environment.

- **Consider Harbor Pond restoration** - Consider restoring Harbor Pond in Townsend, which is heavily eutrophied and filling in, due to sediment transport,<sup>137</sup> to a level that supports increased recreational use, possibly including swimming where appropriate and where sanctioned.

## E: Regional Trail System

### **GOAL E.1: Maintain and enhance regional trail systems.**

#### **Objective: Provide opportunities for hikers and walkers along the rivers and on inter-connecting trails.**

- **Promote trail upkeep and signage** - Encourage maintenance of existing trails and signage; add additional signage as appropriate.
- **Work with volunteer groups** - Increase access to existing trails and provide information for trail users<sup>138</sup> via coordination with local trail committees, such as – for example -- those in Groton and Shirley, and reliance on local volunteers and aspiring Eagle Scouts as in Pepperell.
- **Practice trail stewardship** - Increase monitoring and maintenance of rail trails—notably the existing Nashua River Rail Trail, the soon-to-be constructed Squannacook River Rail Trail, and the undeveloped riverside trails along the Nissitissit River in Pepperell, Massachusetts (these trails are owned by DFW, which has strict regulations for trail maintenance) and in Hollis and Brookline, New Hampshire—as well as other pedestrian-only river access areas. Be attentive to minimizing littering, parking problems, all-terrain-vehicle (ATV) abuses, vandalism, and trespassing on adjacent private lands. Encourage “Adopt-a-Trail”-style projects. For example, the Town of Pepperell has a volunteer-based trail monitoring and maintenance program for town-owned trails available on its

---

<sup>137</sup> Sediment transport is the movement of solid particles (sediment), typically due to a combination of gravity acting on the sediment, and/or the movement of the fluid in which the sediment is entrained. (Wikipedia)

<sup>138</sup> Nashoba Conservation Trust (NCT) and Town of Pepperell together, created a trail guide with details about 16 properties including land protection history (donation, purchase, etc.), details/GPS location of the parking for the property, flora and fauna. The free guide can be downloaded from the Pepperell and NCT websites and is available in iBooks.

Conservation Commission website (see: [www.town.pepperell.ma.us/172/Trail-Monitoring-and-Maintenance-Program](http://www.town.pepperell.ma.us/172/Trail-Monitoring-and-Maintenance-Program) ).

- **Teach multi-use principles** - Help users of the various trails learn how to safely navigate multiple types of concurrent use, e.g., horses, pedestrians, and cyclists simultaneously using the rail trails. Help users identify trails appropriate to their form of recreation, e.g., bicyclists on Nashua River Rail trail; fishing access trails along the rivers; and a canoe portage along the Nashua River Rail Trail in Pepperell.
- **Publish trail guides** - Develop riverside trails guide books or maps, both print and online, for the public to encourage trail use and assist in exploration of such trails<sup>139</sup>. Support and promote regional community trail mapping<sup>140</sup> such as at Montachusett Regional Planning Commission.
- **Promote regional trail system** - Promote additional use of trail easements and linkages to further extend existing formal<sup>141</sup> regional trail system for passive recreational use.

---

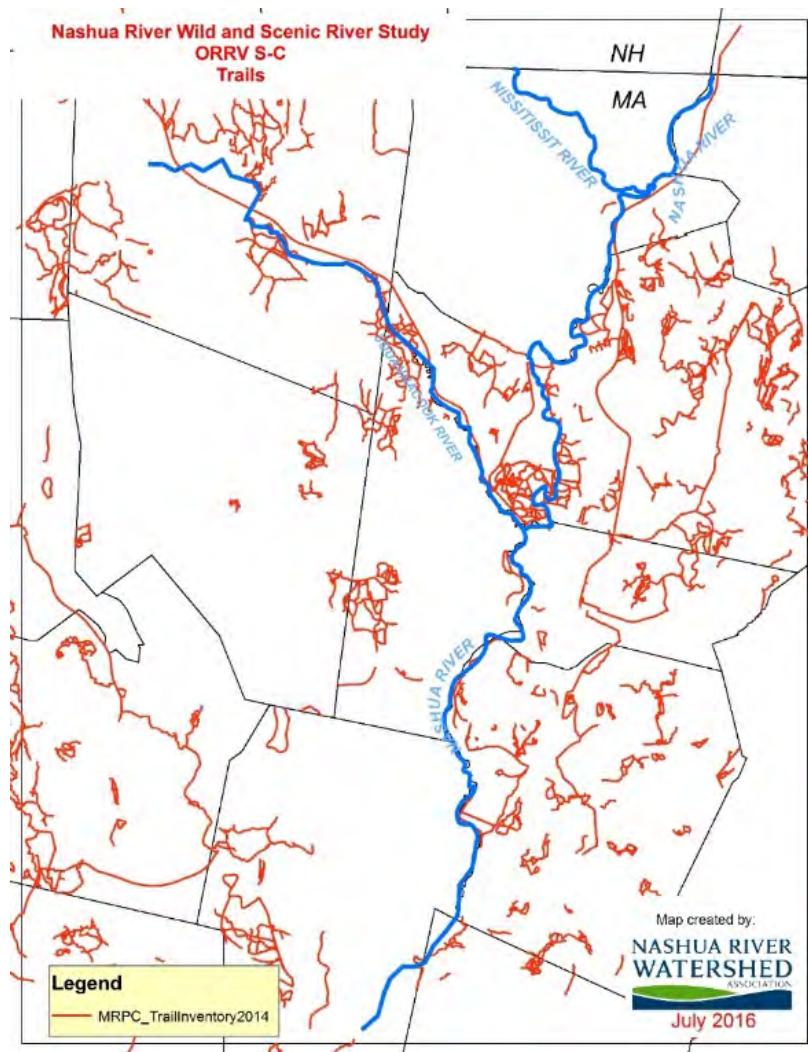

139 For one such example see:

[www.americantrails.org/NRTDatabase/trailDocuments/3846\\_QuinebaugRiverPaddleGuide2012a.pdf](http://www.americantrails.org/NRTDatabase/trailDocuments/3846_QuinebaugRiverPaddleGuide2012a.pdf)

140 [www.mrpc.org/home/pages/community-trail-maps](http://www.mrpc.org/home/pages/community-trail-maps)

141 Formal trails are those on existing protected lands: governmental or private (i.e., land trust holdings or registered Conservation Easements) versus informal trails.

Many towns have the following “Trail Use Disclaimer: It is the personal responsibility of the trail user to verify that the trail is designated for the specific use of interest. Respect property owners’ rights. Conservation areas are generally open to hunting in accordance the Massachusetts law, unless POSTED otherwise. Be aware of hunting seasons and regulations. ATV use is generally not permitted in municipal conservation areas.” ([www.shirley-ma.gov/sites/shirleyma/files/uploads/trails.pdf](http://www.shirley-ma.gov/sites/shirleyma/files/uploads/trails.pdf)) Additionally, note that Massachusetts DFG has a policy of minimizing walking trails.

- **Look for ways to add to rail trails** - Explore opportunities for extending/connecting rail trails (in all directions) for multi-uses and accessibility, while maintaining wildlife habitat.
- **Support regional trail groups** - Encourage the work of regional trails groups such as Montachusett Regional Trails Coalition (see: [www.facebook.com/MontachusettTrails](http://www.facebook.com/MontachusettTrails)).

- **Stay informed about Thoreau Trail** - Follow development of potential “Thoreau Trail” proposed by Freedom’s Way Heritage Association (FWHA) that would cross the Nashua River on its 50+ mile course connecting Walden Pond and Wachusett Mountain.
- **Encourage universal accessibility** - Encourage Americans with Disabilities Act (ADA) accessible trails and wildlife viewing areas where feasible.
- **Consider trails in town planning** - Update municipal by-laws to include trails and greenways as part of site development process. Encourage inter-municipal planning of trails and greenways to encourage cross-regional linkages. There are many opportunities to link trails including at river crossing sites on rail trails.

## F: Other Recreational Activities

**GOAL F.1: Encourage other recreational activities as appropriate.**

**Objective: Be responsive to an existing and evolving variety of recreational interests.**

- **Formalize pet policies** - Clarify appropriate recreational areas for dog owners. Reinforce or create pet waste ordinances (pooper-scooper laws) and restrictions on illegal dumping, such as at Groton Place informal “dog park” along the Nashua River, or otherwise secure and maintain pet waste disposal containers.
- **Consider deer population management** - Conduct browse studies to determine where deer overpopulation is occurring. Encourage deer hunting where setbacks allow to reduce overpopulations that impact wildlife habitat and which also lead to increased tick numbers and resulting increased cases of Lyme disease and other tick-borne illnesses in humans. Consider developing town-specific Deer Management Plans to control exploding deer populations unchecked by other predators since deer are the primary vector for such diseases.
- **Engage public in nature-focused events** - Encourage continued public support and participation in: 1) the annual Groton-Oxbow National Wildlife Refuge Circle’s “Christmas Bird Count”, ongoing since 2000); 2) “Big Night”: early spring first mass amphibian movement activities; and 3) local turtle protection happenings. Encourage development of “wildlife viewing and photography platforms” where appropriate. [Note:

See Mass Audubon Society's "Nashua River Watershed Important Bird Area (IBA) Site".  
[www.massaudubon.org/our-conservation-work/wildlife-research-conservation/statewide-bird-monitoring/massachusetts-important-bird-areas-iba/important-bird-area-sites/nashua-river-watershed](http://www.massaudubon.org/our-conservation-work/wildlife-research-conservation/statewide-bird-monitoring/massachusetts-important-bird-areas-iba/important-bird-area-sites/nashua-river-watershed) ]

## **GOAL F.2: Maintain contact with the public regarding their enjoyment of the rivers.**

### **Objective: Inform the public and be informed.**

- **Publicize Wild and Scenic River program** - Provide Wild and Scenic River program information at community events, fairs, canoe races, fishing events and other public gatherings.
- **Host a Wild and Scenic River event** - Consider developing a signature event, which would annually help further inform the public on the value of the rivers, their outstanding resources, the value of their designation as Wild and Scenic Rivers, and opportunities to engage in stewardship activities.
- **Watch future trends** - Track new types of recreational activities and equipment that cannot be foreseen in the future – such as drone aircrafts emerging today -- to make sure they are compatible with managing and protecting our rivers' ORRVs.
- **Study economic benefits of recreation** - Consider analyzing the economic benefits of recreation in the proposed designated area, possibly in partnership with the Freedom's Way Heritage Association, the regional planning commissions or others.

## **G: Scenic Values**

### **GOAL G.1: Protect scenic views related to our rivers.**

### **Objective: Recognize the importance of views from the rivers and help preserve them.**

- **Protect viewshed** - Encourage protection of traditional New England landscape patterns and scenic visual resources such as the viewshed across the Nashua River valley from the vicinity of Fruitlands Museum. This may include, for example, concerns regarding steep

slopes, building heights, and outdoor lighting.<sup>142</sup> Protect traditional New England landscape patterns and visual resources by supporting resource-based economic activities—“working landscapes”—including sustainable farming, forestry, and ecotourism.

- **Assess exceptional views** - Consider conducting a formal scenic assessment of exceptional views (such as National Park Service’s “Visual Resource Inventory”)<sup>143</sup> to identify resources in need of protection that also include views from on the rivers toward undeveloped shoreline banks as the forested corridor or greenway is a much appreciated aesthetic resource.
- **Consider aesthetics in management plans** - Pay special attention as relates to aesthetics, in addition to forest health, when first drafting Forest Management Plans on Massachusetts public lands along the rivers.<sup>144</sup> The natural, “wild” appearance of the greenways as one recreates on the river is a key component of the special enjoyment the public derives on these rivers.
- **Adopt scenic river provisions** - Encourage municipalities to adopt and enforce "Scenic River Protection" type bylaws (similar to Townsend's Squannacook River Protection

---

142 A reference/example of Devens Viewshed Overlay District containing regulations to limit the visual impact of new development on the Prospect Hill Overlook can be found at [www.devensec.com/rules-regs/decregs304.html](http://www.devensec.com/rules-regs/decregs304.html) - see Section (8)(i) . 143 [www.ncptt.nps.gov/blog/nps-visual-resource-protection/](http://www.ncptt.nps.gov/blog/nps-visual-resource-protection/)

144 There is no requirement that public lands in New Hampshire have a Forest Management Plan.

bylaw and, at the Massachusetts state level, the Squannacook & Nissitissit Rivers Sanctuary Act passed in 1975).

The 15.9-mile-long Squannacook River forms the western boundary of Groton and eventually flows into the Nashua River south of Groton near Ayer. As others did in surrounding areas over time, settlers found the Squannacook River an ideal location to set up mills and utilize the waterpower that was generated.

*Photo 6 Images of America: Groton*

## ORRV #3 - HISTORICAL AND CULTURAL RESOURCES

The historic significance of our rivers in the landscape—and in the relationship of people to the landscape—is evident across the centuries. Our outstandingly remarkable resource values in the Historic and Cultural category range from sites and buildings to nationally noteworthy social experiments. The “Rivers as Corridors” Chapter details the influence of early conservationists, and this chapter shines a spotlight on “The Marion Stoddart Story.” The arc of historical significance that we are tracing starts with the early settlers along the rivers.

**Early Settlers.** The rivers’ abundant food sources and their usefulness for travel made them important to Native Americans, whose presence has been documented by numerous investigations of streamside archaeological sites. One such site suggests a large semi-permanent Nashaway village just south of the Meeting of the Waters, where the North and South Branch of the Nashua join. A second example is a native encampment along the Nashua River in Pepperell (the “Reedy Meadow Brook” site), near its confluence with the Nissitissit River, which is considered a major prehistoric resource.

Nipmuc groups, who called the area Petapawag or a “swampy place,” occupied Groton for many thousands of years. The many wetlands of Groton have played a big part in all of the town’s history, from the earliest settlers many millennia ago to the most recent decades.

Wetlands have served as transportation corridors, life-sustaining sources of drinking water for people, plants, and animals, as well as sources of power and places for recreation. The locations and types of wetlands spread across Groton have influenced how the town has developed and continue to be important to the different themes that make up Groton. The interpretive themes presented in the following section refer back to the role of water and its influence on history within the town.” (Groton Archeological Report, Page 32)

It has been suggested that the region’s geography resulted in unique human settlement patterns. Former Archeological Curator of Fruitlands Museum, Michael Volmar, described the extensive, 1,000+ acre freshwater estuary at the present Oxbow National Wildlife Refuge as being communally used for hunting and gathering by Native Americans. The natural resources—including seasonal shad, salmon, and alewife fish runs—were so abundant as to be a place where different bands could utilize such without concern for the usual territorial boundaries.

While evidence of some settlements has been found, one might have expected more. Local history buffs have pondered if “the lack of settlements was because the Native Americans considered the area sacred. This was their prime hunting ground so they took special care to protect it and keep it wild, [thus] settlements would have degraded it.”<sup>145</sup> There is a high probability of potential Native American archeologic sites in our area that have not yet been identified, according to the Massachusetts Historical Commission (MHC) and local professional historian Michael Roberts of Timelines, Inc.<sup>146</sup>

There is one confirmed Native American Graves Protection and Repatriation Act (NAGPRA) site in the Lake Potanipo area of Brookline, which was found when the ice harvesting facility (Fresh Pond Ice Company) was being constructed in 1905. The remains went through a NAGPRA review managed by Harvard University, and the remains were returned to the Abenaki native tribes in 2001.

Due to the presence of prime agricultural soils in the large floodplains along the banks of the river, there is a long-term agricultural history. Agrarian history dates back to the prehistoric Late Woodland Period. Native Americans burned the land to keep it open, which made it attractive to European settlers who arrived in the 17th century.

**First Towns, Trading Posts, and Mills.** Lancaster was one of the first inland towns established in Colonial America; a Native American trading post was set up near the Nashua River in 1643. Soon after, other European settlers followed to farm the rich soils of the Nashua Valley and, in time, the Squannacook Valley. Originally, it was “first begun for love of the Indians’ trade, but since the fertility of the soil and pleasantness of the river hath invited many more.”<sup>147</sup>

---

145 Robert Pine, Director of Environmental Planning and Engineering at Pine and Swallow Environmental in Groton, Massachusetts, personal communication.

146 It is expected that the town [Groton] includes large Native American sites that would have spanned many millennia. *Petapawag* [Ameri-Indian (Nipmuc) place-name for present-day Groton] would have been attractive to such early settlers, as it is located along one of the area’s major rivers, and it is considered likely that such sites exist in the town. One or more of these sites may contain evidence of Paleoindian occupation that has not yet been recognized, or has been lost. (“Groton Community-wide Archeological Survey,” pages 35-6) There is one other pre-historic site located just across the Squannacook River from Groton, the “Herfco Knoll” site, referenced on page 43 of this same Survey.

147 Massachusetts Historical Commission, *Historic and Archaeological Resources of Central Massachusetts*, 1985), page 62.

In 1653, the first grant to buy land for a town—Lancaster—was along the Nashua River from the Nipmuck Tribe, known as the “fresh water people.” This tribe was associated with the Nashua, or the Nashaway, the “river with the beautiful pebbled bottom.” Over time, the Native Americans did not relinquish this land readily and there were many struggles. The first book written by a woman in America, *A Narrative of the Captivity and Restoration of Mrs. Mary Rowlandson*, records her experience in 1676 as an “Indian” captive taken from Lancaster to Canada.

By the 1770s, Lancaster<sup>148</sup> was the wealthiest agricultural town in the area, largely as a result of the productive lands of the “Nashua interval,” the low-lying, rich bottom lands along the river. Similarly, Ash Swamp, the headwaters of the Squannacook River in Townsend, would become a “highly prized meadowland in colonial times, adjoining lowlands still in agriculture.”<sup>149</sup>

The Nashua River served as barrier to westward settlement for 100 years after the European settlers arrived. A monument near the river in Pepperell marks the site of the last attack by Native Americans in the area in 1745.

In Townsend, a sawmill was established at the Harbor in 1733, and a gristmill was added shortly thereafter. In Ayer, circa 1770, a grist and sawmill (Pierce’s) was built on Nonacoicus Brook, a tributary to the Nashua River in Ayer. Other early mills include a 1739 clothier mill on the Squannacook River (present day “Cooperage”).

Fessenden Mill, on the Squannacook River, at the precursor site of present Sterilite Corporation, consumed 25,000 board feet of lumber daily in the making of barrels. At its

<sup>148</sup> The town of Lancaster was officially incorporated in 1653 as “Lancaster on the Nashua,” summarizing the importance of that water resource to the citizens. See Town of Lancaster’s town seal.

<sup>149</sup> Squannacook River Protection Plan,” 1997, page 33.

heyday, ~1900-1929, the factory employed about 300 people; it closed in 1960. In 1875, Townsend had 11 barrel factories. Townsend's present state forest once belonged to Fessenden's; the land was sold to the state after the devastating fire of 1927, which rendered it useless as a source of material for that barrel factory.<sup>150</sup>

*Photo unknown, “Sample area recommended for informational signage. Scales and Son Saw and Stave Mill/Hollingsworth Paper Mill at Route 225 crossing of Nashua River. This area has the remains of the paper mill and is an excellent location for archaeological/historical signage. This area is on public land.”<sup>151</sup>*

The Petapawag Canoe Launch in Groton is situated on another Native American settlement site. The same spot was later a trading post and witnessed an early 17<sup>th</sup> century skirmish between English settlers and Native Americans. A trading post in the vicinity dates back to 1656, where the owner John Tinker would use the river to transport goods from his home upriver in Lancaster. Groton's first European settlement was located in the nearby J. Harry Rich State Forest, and numerous cellar holes remain from that time. The old stagecoach road from Boston to Keene, New Hampshire ran through the forest to a ford in the river at the present site of the Route 119 Bridge known as the “Stoney Fordway” or “Stoney-wading-place.”

---

150 “Squannacook River Protection Plan,” 1997, pages 41-42.

151 University of Massachusetts, “Groton Community-Wide Archeological Reconnaissance Survey,” (March 2011), page 84, fig. 4-6.

The first settlement of Groton by European Americans was heavily shaped by the water resources of Petapawag. The rivers were used for travel. The wetlands were filled with abundant flora and fauna, and the many wetlands frequently flooded nearby plains, richly fertilizing the soils. This initial European American settlement was also influenced by their predecessors, the Nashaway Nipmuc. In the same way that the primary transportation route was along the Nashua River for the Nipmuc, the first reported permanent settlement was situated on the Nashua River. This first settlement was a trading house established in 1656 to conduct business with the Nipmuc. The trading post focused on commerce in furs. Around 1655 the trading post was operated by John Tinker (Michael Roberts, 2010), and was situated at the confluence of Nod Brook and the Nashua River. Settlers and their families soon followed the first traders, drawn by the environmental diversity, with freshwater resources for fishing, and fertile soils for farming. The trading post evolved into an early seventeenth century frontier European American settlement.... [A] second main settlement cluster developed in West Groton. Situated advantageously within a "V" formed by the Nashua and the Squannacook Rivers, West Groton arose as a late industrial period New England mill village.<sup>152</sup>

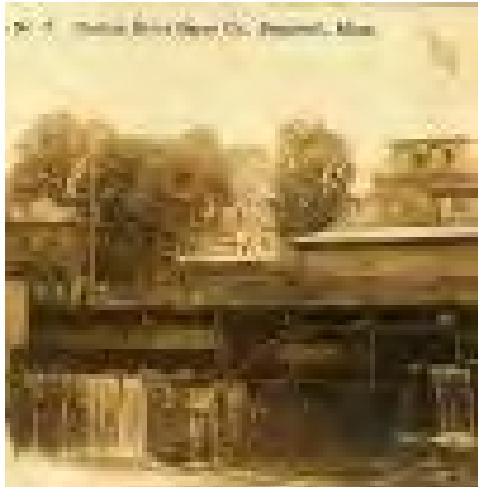

The village of West Groton is situated on the Squannacook River, pictured on the left of the map.

#### *From Images of America: Groton*

The Nashua River provided the original impetus for Pepperell's growth, when in 1730 a gristmill was established at Babbitasset Falls, site of the present dam. Paper mills operated continuously at this site from 1835 to 2002. Today, the run of the river Pepperell Dam is used to generate hydropower.

152 Groton Archeological Survey, pages 48 and 50.

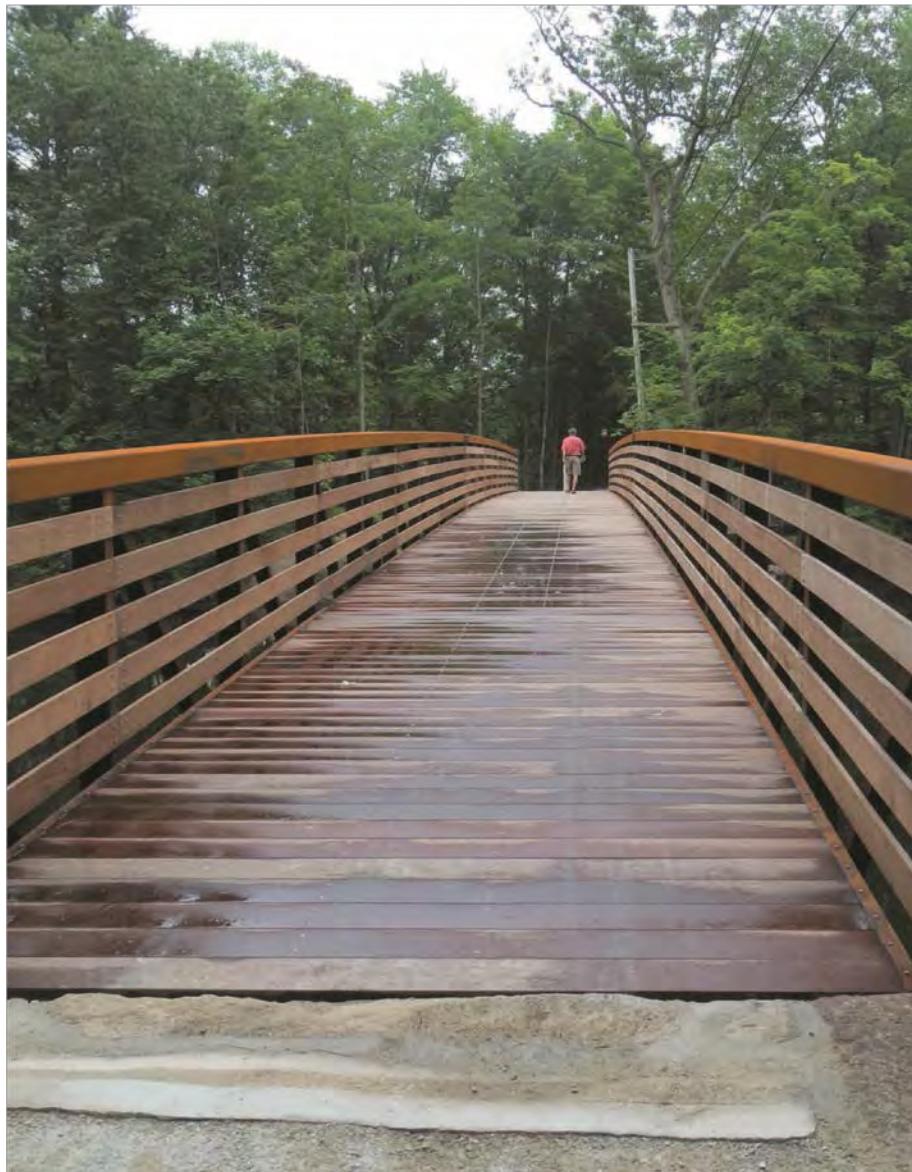

Several different mills were located on the Nashua River, where the road leading to Pepperell goes off. In the 18th century, there was a corn and sawmill at this location. During the 19th century, the mill was used first as a sawmill and gristmill before new buildings were constructed by the Hollingsworth Paper Mill. This may have been a branch of the Hollingsworth Mill in West Groton.

Regarding another mill, in 1843 the Hollingsworth brothers of Groton were granted a patent for manufacture of paper. In 1846, their mill on the Squannacook River in West Groton burned and was rebuilt. In 1881, Zachary Hollingsworth formed a partnership with Charles Vose. By 1955, the West Groton division of the international Hollingsworth and Vose Co. manufactured approximately 25 tons per day of specialized industrial paper. The mill has remained in continuous operation since 1852.

It is interesting to note that many of the tributaries to our rivers also have historic mill sites; for example, the site of the historic Shoe Shank Mill on the North Nashua River.

The site of the first bridge in Groton to span the Nashua River in 1725 is near the current Fitch's Bridge.<sup>153</sup> It carried the old county road, one of the oldest westward trails, leading to the then-wilderness of New York. In 2013, the Town of Groton voted overwhelmingly to expend a considerable sum of municipal funds to restore this historic bridge for pedestrian use.

---

<sup>153</sup> Groton Community-Wide Archeological Survey, page 82.

The area where the Ayer Ice House Dam (presently Ice House Partners, aka Grady Research) is located includes the site beside the Old Shirley Road where hydropower was first used in 1790. The area was purchased in 1871 by Mr. William Mitchell to open a wool shoddy mill. His new company would take inferior wool remnants and turn them into affordable wool clothing. In 1873, the profitable facility burnt down. Even though he only had the company for two years, the area has always been referred to as “Mitchellville.”

There have been other businesses at that location that also used the water power provided by the Nashua River. In 1906, a power plant there was used by the Fitchburg and Leominster Street Railway. They would provide trolley service from Ayer to as far away as Fitchburg, Leominster, and Lunenburg and their electricity powered Whalom Park. After it was retired as a trolley system power station, it was purchased in 1933 by Mr. Michael Horgan, who used the facilities to generate his own power to make ice.<sup>154</sup>

**National Noteworthy Social Experiments and Efforts.** Three social undertakings are particularly noteworthy. Fruitlands Museum, a regional resource situated on 210 acres in Harvard, abuts the Oxbow National Wildlife Refuge. It includes the Fruitlands Farmhouse, a National Historic Landmark built in 1826 and home to Bronson Alcott's utopian experiment in agriculture and intellectual living in 1843. While short-lived, the experiment was influential in the Transcendentalist movement. Second, a Shaker Village existed along Nashua River in

---

<sup>154</sup> Barry Schwarzel, Ayer Historical Commission, personal communication on November 8, 2017.

Shirley from the late 1700s to the early 1900s. Third, a Historic District along the Squannacook River in Townsend Harbor is known as a “safe harbor” due to the local Abolitionists who participated in the Underground Railroad network. The Conant House, reputed to be the oldest house in Townsend, is also reputed to be a “safe house.” Another source indicates that the name “Harbor” derives from the earliest days of the colonial settlement, when four fortified garrison houses were located in the area to provide refuge during Native American attacks.<sup>155</sup>

**Historic Properties, Districts and Army Camps.** Harvard has three properties that are listed in the National Register of Historic Places: Fruitlands Museum (which is also a National Historic Landmark), Still River Baptist Church, and the Fiske Warren House, now part of Saint Benedict’s Abbey abutting the Nashua River. There are four National Register Districts: Vicksburg Square at Fort Devens, Fruitlands Museum, Harvard Center, and Shaker Village. Harvard has two local historic districts, Harvard Center and Shaker Village. Another National Register District is the Shirley Shaker Village (now part of Massachusetts Department of Corrections MCI-Shirley) near the banks of the Nashua River. Shirley was named “the Most Historic Small Town in the Nation.”<sup>156</sup> Devens has a Fort Devens Historic District and 89 properties listed on the National Register of Historic Places, four historic archeological sites, and one prehistoric archeological site.

A highlight of mid-19<sup>th</sup> century cultural history in our area is the former Civil War Camp called "Camp Stevens." It was built on the banks of the Nashua River along a stretch of the old Fitchburg Road. (The KTR European Motor Sports business occupies the old camp property today.) A memorial on the property commemorates the 950 men who served there and in the 53rd Regiment Massachusetts Volunteer Infantry. On November 2, 2013 the memorial was rededicated, following extensive work funded by the town of Ayer and a grant from the Massachusetts Sesquicentennial Committee to improve the site and allow easier access to the memorial.

---

155 See the Townsend Historical Society at [www.townsendhistoricalsociety.org/ths.html](http://www.townsendhistoricalsociety.org/ths.html).

156 Shirley Historical Society, “Most Historic Small Town in the Nation” at [www.shirleyhistory.org/mosthistoric.htm](http://www.shirleyhistory.org/mosthistoric.htm).

A related component of 20<sup>th</sup> century cultural history is that parts of Ayer, Harvard, Lancaster, and Shirley were chosen as US Army Post Fort “Camp” Devens during World War I, where over 100,000 soldiers trained. It was substantially expanded during World War II to approximately 5,220 acres to become the largest military installation in New England. Notoriously, Fort Devens was the epi-center of the 1918 Influenza Pandemic. A Fort Devens Museum (incorporated in 2001) is dedicated to preserving the history of Camp Devens and Fort Devens.<sup>157</sup>

While Fort Devens was active, the US Government conducted many studies of Devens and the surrounding region; indeed, Plow Shop Pond in Ayer is considered one of the most well-documented ponds in the country.<sup>158</sup> According to MassDevelopment, the US Army has spent approximately \$160 Million to date in the environmental clean-up of Fort Devens. The Army base closed in 1996 leading to the expansion of Oxbow National Wildlife Refuge, which was initially established in 1974, through a number of land transfers from the Department of Defense to the US Fish and Wildlife Service. The Service acquired the Watt Farm, an additional 120 acres in the Town of Harvard in 2001.

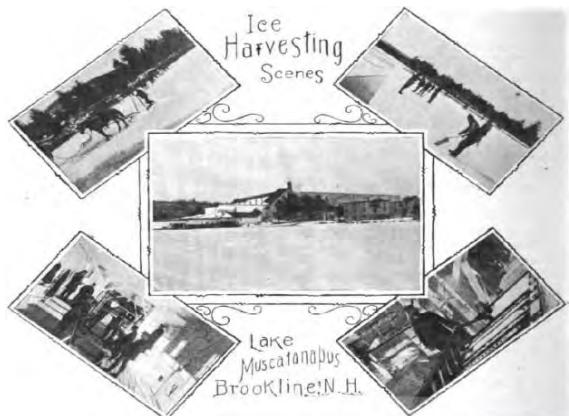

**Railroads.** Interestingly, in 1846 the Nashua River valley became a railroad corridor to New Hampshire from Ayer and Worcester. Similarly, in 1847, the Peterborough and Shirley Branch Railroad was opened through the Squannacook River corridor; thus, Ayer became the center of both south-to-north and east-to-west rail line. Additionally, since these railroads no longer operate, the Nashua River Rail Trail was built in 2002 and the Squannacook River Rail Trail will probably be completed in 2019.

Just prior to 1900, a railroad from Massachusetts to Milford, New Hampshire was built along the Nissitissit River over which, in the days before refrigeration, two daily shipments of ice were transported by the Fresh Pond Ice Company from Lake Potanipo in Brookline, New Hampshire to Boston for transport by clippers to such faraway places as Hawaii and India.

**“The Marion Stoddart Story” of River Restoration.** As described in Chapter 3 “The Rivers as Corridor,” our area has a considerable history of having produced notable early conservationists including Benton MacKaye, William Wharton, Ellen Swallow Richards, Jeffrey P. Smith, and others. Each of these persons was influenced by this region’s natural resources and took steps to conserve such. Marion Stoddart, who moved to Groton in the 1960s, is renowned for her conservation efforts.

In the 1960s when there were no laws against dumping pollutants into waterways, a group of concerned citizens set out to restore the Nashua River, one of the nation’s ten most polluted rivers. They dared to envision the unthinkable: “sparkling blue water with a ribbon of green along its banks.” They advocated for a revitalized river corridor that would be safe for people and wildlife alike. Led by Marion Stoddart, they galvanized the attention of towns, government

agencies, businesses, and other residents—and soon all joined in pursuing the ambitious restoration goal.<sup>159</sup>

Although the Nashua River is thought to be a native word for “river with a clear- or pebbled-bottom,” by the 1960s its recovery seemed an impossible task as the river—known locally as the “Nauseous River” because of its awful smell—was all but biologically dead. One could smell the river from more than a mile away, riparian real estate was worthless, it notoriously ran various colors from dyes dumped into the river by the paper mills, and the only wildlife were rats and sludge worms. Sludge banks along the Nashua exceeded five-foot depth in places.

Visually, the Nashua is, in short, revolting. Sludge and scum fill the stream, and discoloration and turbidity resulting from paper mill discharges and other wastes can be found throughout most of the river’s length. Fermentation bubbles are ubiquitous and obnoxious odors constitute a widespread nuisance.<sup>160</sup>

The river was so grossly polluted in 1969 that Fort Devens military personnel were warned to stay away from it. It was locally thought that if you fell into the river you should go to the hospital for inoculations. It had a “U” designation signifying “unsuitable,” meaning its

160 Nashua River Watershed Association, “Plan for the Nashua River Watershed,” 1972, page 40.

condition did not meet any of the existing water quality standards classifications.<sup>161</sup> Even the 1952 *Conservation Land Use Plan for the Town of Groton MA* stated “...the Nashua River and the lower end of the Squannacook River, are so badly polluted that they have little value to Groton for any purpose.”<sup>162</sup>

In 1962, having rallied friends, neighbors, and local officials to work with her, Marion and others formed the Nashua River Clean-up Committee. That Committee advocated for higher water quality standards for the river through the Massachusetts Water Quality Standards established in 1967 (see Appendix B), and she even delivered a bottle of dirty river water to the then-Governor of Massachusetts, John A. Volpe. The Committee worked tirelessly for the passage of the federal Clean Water Act, solicited support for the clean-up from federal, state, and local government officials, engaged mill and other business owners in the cause, and educated citizens in every watershed town about the need to restore the river.

As the work of the Clean-up Committee progressed and drew more support, the decision was made to establish a non-profit environmental organization. In 1969, the Nashua River Watershed Association was formed. The Incorporators of the Association included community leaders from throughout the watershed, including Lee P. “Bill” Farnsworth, Benton MacKaye, Jeffrey P. Smith, William Wharton; and, of course, Marion Stoddart. Marion’s story has become the basis of the award-winning documentary *Work of 1000*, which is described on the following pages.

“Changing values and attitudes, diligent enforcement of environmental laws and regulations, educational programs by schools and NGOs, the shift from manufacturing to service industries initiated the process of ecological recovery. The rate of recovery in the well-watered temperate climate of southern New England has been nothing short of remarkable.”<sup>163</sup>

---

161 “Class A waters were designated as sources of public water supply. Class B waters were designated for aquatic life, recreation (swimming and boating) and aesthetics. Class C waters were designated for indigenous aquatic life, limited recreation (boating) and aesthetics. Class D waters were designated for aesthetic enjoyment only.” From Appendix C: Warren Kimball, History of Water Quality in the Nashua River and Tributaries.

162 It went on to say “There is not much that any town below the source of pollution can do to correct this condition beyond cooperation with the other towns affected, the industries concerned, and the State Department of public Health, which is working on the problem. We can make no recommendation other than the full cooperation of the town with the above agencies.” 1952 *Conservation Land Use Plan for the Town of Groton Massachusetts*.

163 Paul Barten et al., “Land Conservation, Restoration, and Stormwater Management for the Squannacook and Nissitissit River Watersheds, MA & NH,” (2001).

It took a quarter of a century to clean up a river that was "too thick to pour, too thin to plow."<sup>164</sup> Today, a sparkling blue Nashua River runs from central Massachusetts to southern New Hampshire. It hosts many of the state's most popular fishing tournaments. Flora and fauna thrive in it, canoeists revel in it, and swimmers splash in some sections of it. It is now a nationally recognized example of river restoration. [See Appendix C: *History of Water Quality*, Warren Kimball.]

This inspiring story has been retold in *A River Ran Wild: An Environmental History* by Lynne Cherry, a children's non-fiction book first published in 1992, frequently used in school curriculums throughout the nation to address human effects on the environment, to show the changes of pollution throughout history, and to show how people in each period affected the Nashua River.

In 1993, *National Geographic* magazine spotlighted the Nashua River's recovery in an article entitled "The Promise of Restoration: New Ideas, New Understanding, New Hope" in its special edition "The Power, Promise, and Turmoil of North America's Fresh Water." The article used dramatic "before and after" images of the North Nashua River, which continue to attract the most attention at the NRWA River Resource Center.

In 1987, the United Nations honored Stoddart, naming her to the "Global 500 Roll of Honor." *National Geographic*'s 2010 "Water: Messages of Hope for Earth's Most Precious Resource" contains an essay on the Nashua River clean-up by Marion Stoddart. Most recently, her story and that of the Nashua River were made into an independent, critically acclaimed documentary film, *Marion Stoddart: The Work of 1000*,<sup>165</sup> which speaks to a model for effective leadership, advocacy, grassroots organizing, and coalition building to achieve one's vision. Our locally celebrated natural resources are also a symbol of success.

---

164 Nashua River Watershed Association, "Plan for the Nashua River Watershed," (1972), pg. ii.

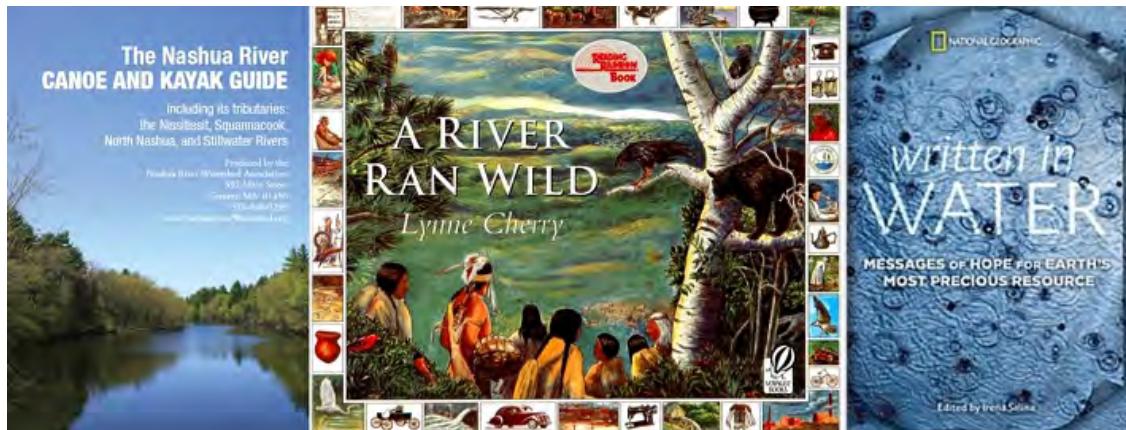

165 Susan Edwards and Dorie Clark, "Marion Stoddart: The Work of 1000," (2010). See Documentary Educational Resources at <http://www.der.org/films/work-of-1000.html>.

The river's recovery has sparked recreational use at places like the Oxbow National Wildlife Refuge; J. Harry Rich State Forest; Townsend State Forest; the Bolton Flats, Squannacook River, and Nissitissit River Wildlife Management Areas; and the Groton and Shirley Town Forests, to name but some of the conserved lands abutting the rivers and protecting their shorelines.

## Some Key Findings on the Exemplary Status of Historic and Cultural Features

- The story of the Nashua River clean-up has merited international acclaim and has served as a model for watershed groups across the nation. The Nashua River, once one of the top ten most polluted rivers in the country, was revitalized due to the efforts of internationally recognized Marion Stoddart and others.
- The polluted “before” and revitalized “after” iconic photos of the North Nashua River instantly communicate this story, which has been recounted in the children’s book “A River Ran Wild” by Lynne Cherry. The book has sold more than 1,000,000 copies and is often used in classroom curriculums.

*Photo 7 NRWA Archives*

- Marion Stoddart was recognized by the United Nations Environmental Program in 1987. The story of the clean-up was featured in *National Geographic* magazine.
- The story of the clean-up and Stoddart’s role was documented in Susan Edward’s award-winning film “Marion Stoddart: Work of 1000,” which has been shown in over two dozen film festivals across the country.
- Several notable early conservationists including Benton MacKaye, William P. Wharton, Ellen Swallow Richards and Jeffrey P. Smith, among others, were influenced by this region’s natural resources and took steps to conserve these resources.

- Parts of Ayer, Harvard, Lancaster and Shirley were chosen as US Army Post Fort “Camp” Devens during World War I and expanded during World War II to ~5,220 acres to become the largest military installation in New England.
- Fruitlands Museum is a regional resource on 210 acres in Harvard that abuts Oxbow National Wildlife Refuge. The Museum includes the site of a former Transcendentalist community, the site of Bronson Alcott's 1843 short-lived utopian experiment in agriculture and intellectual living.
- The Nashua, Squannacook, and Nissitissit Rivers are all included in the federally designated Freedom's Way National Heritage Area. A few of the many outstanding resources acknowledged by this designation: The site of a major prehistoric resource, a Nashaway village, by the Meeting of the Waters where the North and South Branch of the Nashua join; and a native encampment near the confluence of the Nashua and Nissitissit Rivers in Pepperell. Also, the 1,000+ acre freshwater estuary at the present Oxbow National Wildlife Refuge is noteworthy as being so rich in natural resources as to be communally used for hunting and gathering by the indigenous Native Americans, irrespective of territorial boundaries.
- The first book written by a woman in America, *A Narrative of the Captivity and Restoration of Mrs. Mary Rowlandson*, records her experience as an “Indian” captive taken from Lancaster to Canada and later ransomed back home.
- The presence of prime agricultural soils in the large floodplains along the banks of the Nashua River were historically significant to the founding of the first colonial towns and are still heavily utilized to this day.

## Historic and Cultural Action Plan

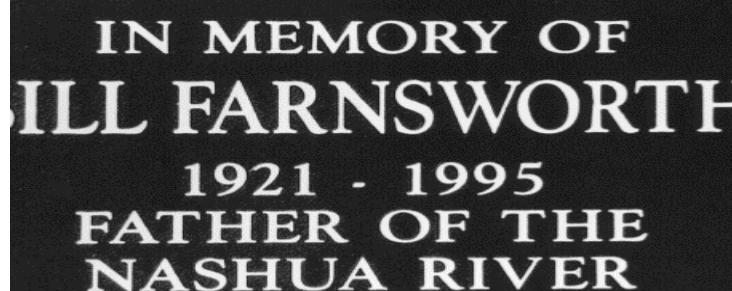

### A: Regional Conservation Ethic

**GOAL A.1: Celebrate the roles of influential conservationists inspired by the Nashua, Squannacook, and Nissitissit Rivers.**

**Objective: Deepen our understanding of local conservationists.**

- **Learn from the legacy of conservationists** - Encourage further research into the lives, legacy and impact of local conservationists Benton MacKaye, William Wharton, Jeffrey P. Smith, Lee P. "Bill" Farnsworth, Ellen Swallow Richards, Marion Stoddart, and others. (For more information on these notables, see Chapter 3: The Rivers as Corridors.)
- **Use their legacy to teach conservation** - Encourage displays and programs that draw the public's attention to the work of these early conservationists and their connection to our region.

BRUCE "BILL" FARNSWORTH (1921–  
Born in Lancaster, longtime resident  
Farnsworth initiated the Nashua River  
Committee in 1962 and, in 1963,  
helped found a Nashua River greenway.  
Regionally, he is credited with  
the Nashua River Watershed  
Initiative with Marion Stoddart of  
and several area people in 1969.  
years, he continued as a member  
and director. (Farnsworth.)

FARNWORTH MEMORIAL BRIDGE AND PLAQUE. In 1995, the bridge spanning the Nashua Road in Lancaster was named for Bill Farnsworth, who had spent more than 25 years working to make the Nashua River healthy again and to ensure that with a "ribbon of ore

**GOAL A.2: Foster, stimulate, and support the next generation of conservationists.**

**Objective: Inspire youth stewardship.**

- **Teach youth conservation** - Develop and support programming that introduces youth to the concept of a conservation ethic and helps deepen their own conservation ethic.
- **Teach watershed planning and management** - Work with local educational institutions within the Nashua River watershed and Squannacook and Nissitissit River sub-watersheds to incorporate watershed planning and management into existing school curriculums and activities.

## B: River Renewal

**GOAL B.1: Preserve the history of the clean-up of the Nashua River as a national model and preserve “the Marion Stoddart Story.”**

**Objective: Assure continued access to the historic story.**

- **Preserve the history of the Nashua River clean-up** - Support the NRWA in maintaining and adding to the materials in its Conservation Clearinghouse regarding the historic clean-up of the Nashua River, including Marion Stoddart’s efforts to control discharge into the river.
- **Celebrate “A River Ran Wild”** - Encourage the continued use of “A River Ran Wild” in schools and groups for youth; recognize and celebrate the impact the book has had across the country and internationally.

**GOAL B.2: Use the above goal as a springboard for initiating contemporary activities.**

**Objective: Enable the story to be a “living story.”**

- **Spread the message of Marion Stoddart** - Develop programming and materials as appropriate to continue to tell “The Marion Stoddart Story” to a variety of audiences.
- **Use Marion Stoddart’s work to inspire citizen action** - Develop programming and materials to utilize “The Marion Stoddart Story” as inspiration for undertaking local environmental projects that can be influenced or accomplished by citizen action—champion the difference that one person can make.

- **Build grassroots advocacy** - Encourage multiple partners, including land trusts, local, state, federal, and other entities to promote successful grassroots advocacy and be involved in protecting gains made during the clean-up and assure continued progress.
- **Engage users who affect water quality** - Engage with businesses (including farmers) and municipalities whose discharges impact water quality through promotion of watershed management.

### **GOAL B.3: Continue to document the River Renewal.**

#### **Objective: Recognize importance of the data.**

- **Continue water quality monitoring program** - Continue the NRWA Volunteer Water Quality Monitoring program, started in 1992 and now in its 25th consecutive year; preserve previous water quality data from other sources as available.
- **Continue to operate USGS river gage** - Ensure continued monitoring of the US Geologic Service (USGS) gage on Squannacook River at Bertozzi Conservation Area, which has been operating and providing water flow records since 1949, and the Pepperell gage on the Nashua River, which has been in operation since 1935.

### **GOAL B.4: Educate and engage the public in the ongoing story of the renewal of the river and what needs to be done to keep the rivers as healthy as possible.**

Objective: Encourage public engagement and action.

- **Teach watershed science** - Educate citizens about the geographic extent and functions of the Nashua, Squannacook, and Nissitissit Rivers watersheds, the specific needs for protection of and improvement to the rivers systems, and the benefits of a healthy watershed to individuals and communities.
- **Promote stewardship** - Encourage the public to speak out on issues and to participate in the stewardship of the proposed designated area.
- **Build an educational network** - Encourage organizations with existing education and outreach programs to continue and expand their efforts, through cooperation among those organizations. Develop methods to provide information and education about the Nashua, Squannacook, and Nissitissit River watersheds.

- **Champion the river as a classroom** - Support “on-water education,” notably NRWA’s River Classroom® program with Nashoba Paddler, which was started in 1998.
- **Inspire Greenway Heroes** - Promote the “Greenway Heroes: Profiles in Land Conservation®” short inspirational film on local land protection and similar materials to be produced in the future.

## C: Historical and Cultural Features

**GOAL C.1: Identify, protect, and enhance important historical and cultural features, sites, and pathways related to the rivers and recognize the importance of the rivers to the development of the communities.**

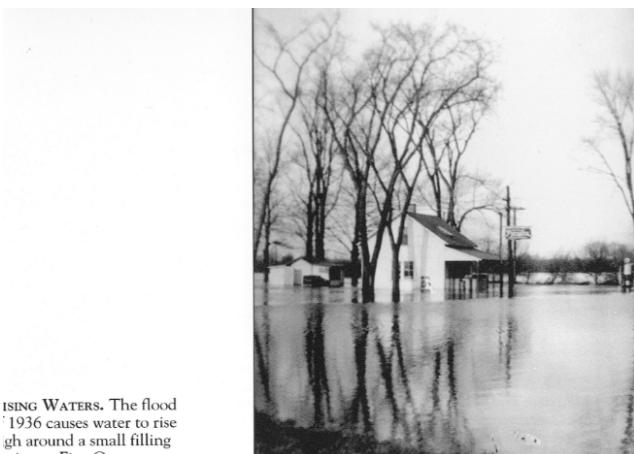

**Objective: Stimulate additional engagement with historical and cultural features.**

- **Study our historical relationship with the river** - Encourage local historical societies and other entities as appropriate to undertake further research into the historical relationship between the adjacent communities and the rivers (i.e., Babbitassit Falls, aka Pepperell Dam).
- **Emphasize our connection with the river** - Develop materials and public programming to highlight the connection between the communities and the rivers and to foster increased appreciation.
- **Consider economic benefits of historic-cultural focused tourism** - Consider doing an “economic benefits” analysis of historic-cultural focused tourism in the subject region, possibly in cooperation with Freedoms Way Heritage Association and regional planning commissions or others.
- **Consider maintenance and restoration of sites** - Consider maintenance and restoration of historic and cultural sites, for example, the Cooperage in Townsend Harbor.
- **Work on tributaries** - Consider similar work on features located on tributaries as well, such as Ponakin Bridge, an 1871 post truss bridge on the North Nashua River in Lancaster, in the National Register of Historic places.

## GOAL C.2: Recognize and protect important landscape features related to the rivers.

### Objective: Take protective actions as appropriate.

- **Expand greenways** - Continue the expansion of a protected greenway along the rivers, their tributaries, and their headwaters.
- **Preserve agricultural soil** - Protect prime agricultural soils in the large floodplains along the banks of the rivers, which were historically significant to the founding of the first colonial towns and are still utilized to this day.

ISING WATERS. The flood of 1936 causes water to rise high around a small filling station at Five Corners.

SEVEN BRIDGE ROAD. This road, which actually has seven bridges, was built sometime after 1800 as a toll road or turnpike. It was not accepted as a town road until years later. This view of what is present-day Route 117 shows some very low land on the Nashua floodplain.

Photos 86 & 17: *Images of America: Lancaster*

- **Protect historical and cultural character** - Raise awareness so that new development along the river corridors is compatible with the historical and cultural character of the surroundings and fully reflects the need to protect those amenities, including mill redevelopment (for example, RiverCourt Residences in West Groton).
- **Protect traditional landscapes** - Protect traditional New England visual resources and landscape patterns<sup>166</sup>—typified by colonial mills along rivers, leading to creation of a road system to connect the mills with town centers and farms, and in time by the presence of smaller villages which grew around mills—by supporting resource-based economic

---

166 “Lancaster’s rivers, its riverfront land, its traditional settlement pattern, and its extensive natural resources also are at the centerpiece of its historic heritage. Early settlers built homes and hamlets at the confluence of the rivers. Access in and out of town depended upon the bridges over these rivers.” (from page 1 [www.ci.lancaster.ma.us/sites/lancasterma/files/uploads/plan\\_historic\\_pres\\_element\\_v1.pdf](http://www.ci.lancaster.ma.us/sites/lancasterma/files/uploads/plan_historic_pres_element_v1.pdf))

activities or “working landscapes” including sustainable farming, forestry, and ecotourism, in any way possible.

A group of Hollingsworth and Vose workers pose outside the mill. Mills had various jobs available and the workers here are a variety of different ages, both men and women. Most workers lived in the immediate area and were dedicated workers for many years. Oftentimes workers using was set up in small buildings by the river.

The Groton Leatherboard Company established business in a mill on the Squannacook River West Groton and was incorporated in 1899. It ran continuously until 1914 when the building was destroyed by fire. A more modern structure was built of brick, which was thought to be fire-resistant, and business resumed in 1916. The company operated until 1970, when it closed.

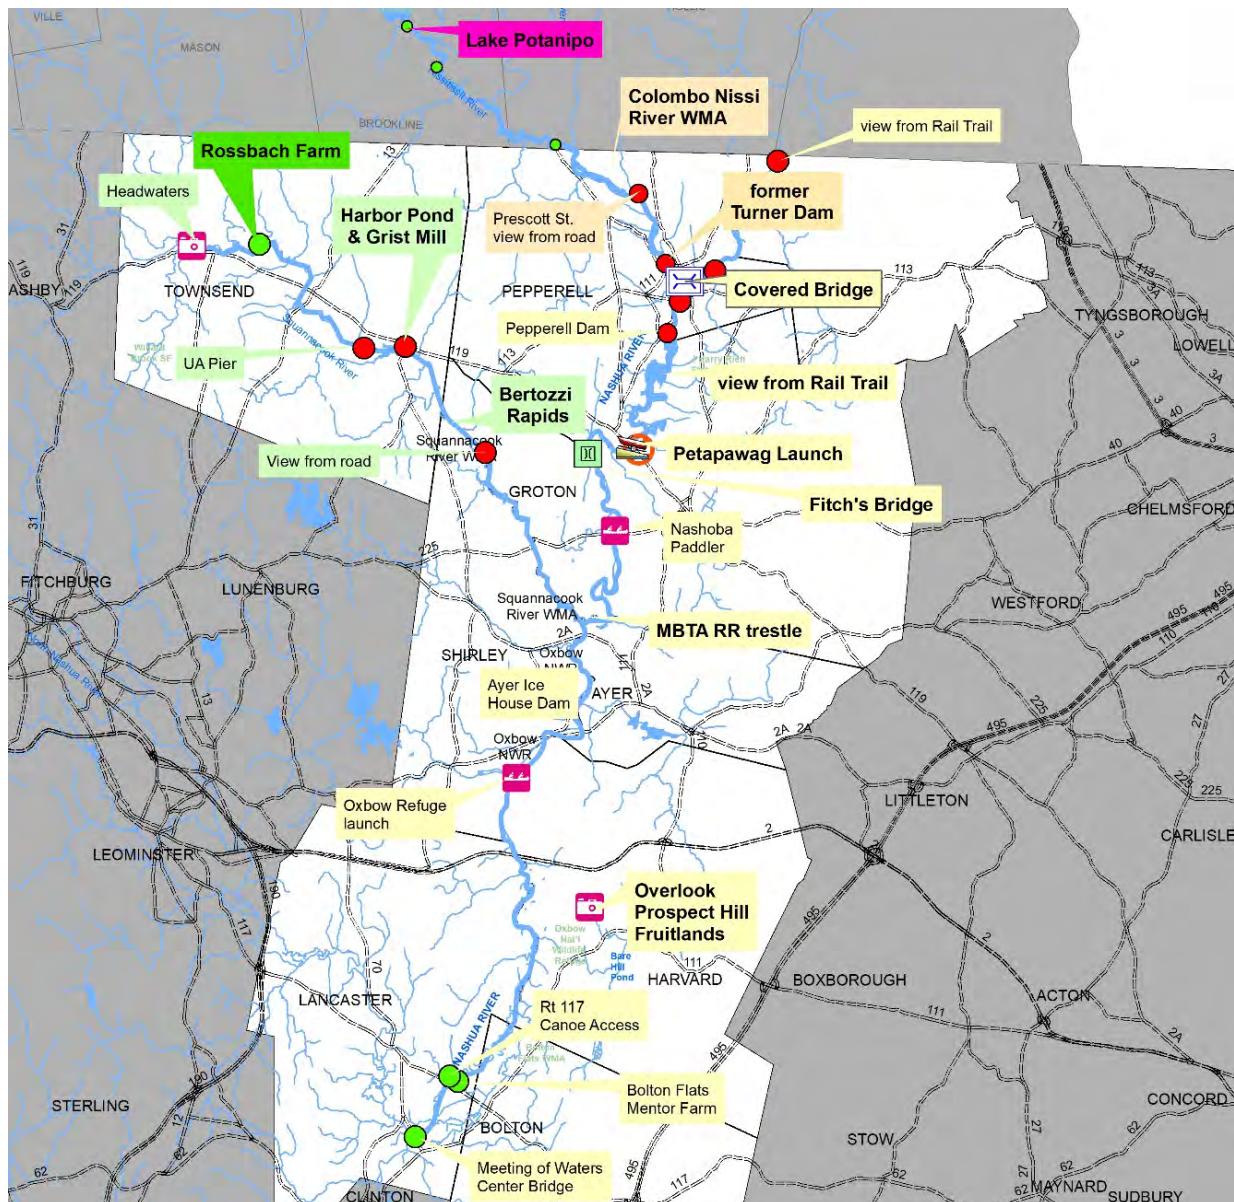

*Photo 17 & 18 Images of America: Groton*

- **Nominate historic sites** - Develop documentation leading to the nomination of historic sites, an example of which is Surrenden Farm’s nomination to the National Register of Historic Places as a “Rural Historic Landscape.”<sup>167</sup>
- **Conduct a visual inventory** - Conduct a National Park Service “Visual Resource Inventory”<sup>168</sup> for important sites on all three rivers.

---

167 See page 6, Surrenden Farm Resource Management Plan DRAFT October 2016 [www.townofgroton.org/DesktopModules/Bring2mind/DMX/Download.aspx?PortalId=0&EntryId=21444](http://www.townofgroton.org/DesktopModules/Bring2mind/DMX/Download.aspx?PortalId=0&EntryId=21444).

168 National Park Service, National Center for Preservation Technology and Training, NPS Visual Resource Protection at [www.ncptt.nps.gov/blog/nps-visual-resource-protection/](http://www.ncptt.nps.gov/blog/nps-visual-resource-protection/).

Map 4 NRWA

- Protect prehistoric resources** - Investigate and protect all major prehistoric resources, including but not limited to the following sites: a Nashaway village by the Meeting of the Waters where the North and South Branches of the Nashua join, and a native encampment near the confluence of the Nashua and Nissitissit Rivers in Pepperell.

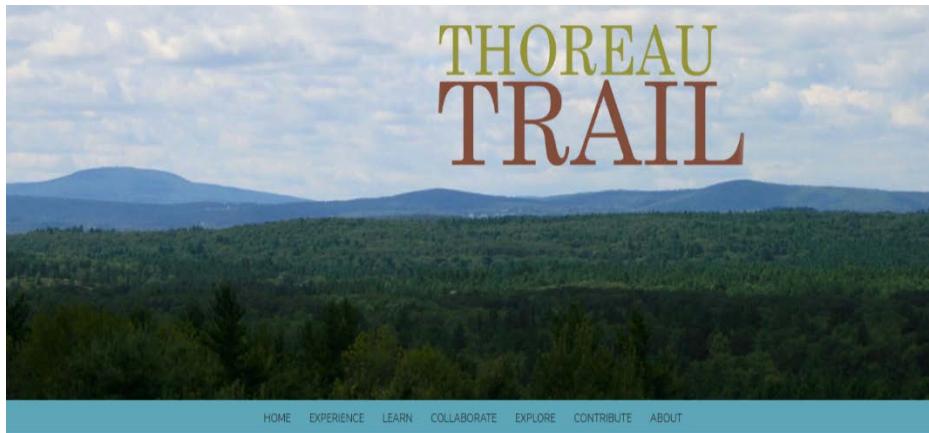

- **Consider interpretive signage** - Pursue suggestions in regards to interpretive signage of prehistoric resources.<sup>169</sup>
- **Protect post-colonial sites** - Protect post-colonial sites such as the Shaker Village along Nashua River (described on the National Register of Historic Places as an “ethnographic Shirley landscape”), which functioned from the late 1700s to the early 1900s.<sup>170</sup> Encourage further protection of the Shirley Shaker Village and prevent further degradation of remaining buildings.
- **Develop compatibly** - For any new development along the river corridors that towns have accepted, encourage compatibility with existing historic development.
- **Study and document historic and cultural resources** - Encourage further study of historical and cultural resources cited in the three Areas of Critical Environmental Concern to better understand, manage, and protect them (for example, post-colonial river fords like Union Turnpike in present-day Harvard). Document such historic sites, even if lacking structures, and landmark them with plaques (e.g., Thompsonville in West Groton and the riverside trading post of John Tinker, Groton’s first settler, in J. Harry Rich State Forest).
- **Consider restoring Grist Mill for operation** - Consider rehabilitation of the Grist Mill (owned by the Townsend Historical Society), immediately downstream of the dam at Harbor Pond in Townsend, to allow for public demonstration of an historic mill operation.
- **Address structural needs of dams** - Pay attention to opportunities for comment and input on structural issues surrounding dams, particularly the Canal Street (aka Mason Road) Dam in Townsend.

---

169 The “Groton Community-wide Archeological Survey” suggests: “Several locations have been established along the Nashua River where large Native American settlements might have existed. Therefore, a suitable location for a sign would be a roadside view with a vista of the Nashua River or other scenic area to provide a sense of landscape...Content should also describe the Nipmuc homeland over the 12,000 years of occupation including that they were mobile people who moved with the seasons and made heavy use of the river for transportation, water, and food.” (page 82)

170 Historical and archaeological information is sensitive in nature; therefore, specific site locations are not identified in public documents.

- **Support a Thoreau Trail** - Support development of potential “Thoreau Trail,” proposed by Freedom’s Way Heritage Association (FWHA), which would cross the Nashua River on its 50+ mile course connecting Walden Pond and Wachusett Mountain.<sup>171</sup>

- **Encourage participation in Freedom’s Way Heritage Association** - Encourage greater participation in Freedom’s Way Heritage Association activities, as a community’s sense of place depends in part upon knowledge of its history, especially when historical sites and documents can be enjoyed first-hand.
- **Support preservation at Fruitlands Museum** - Encourage Fruitlands Museum to permanently protect undeveloped portions of its 200+ acre campus and its historic view.
- **Provide environmental education** - Provide continued environmental educational opportunities for a broad audience. Develop methods to provide information and education about the subject rivers.
- **Pursue archeological investigations** - Support grant applications and efforts by the towns to undertake archeological investigations as appropriate.<sup>172</sup>

---

<sup>171</sup> Be mindful of the August 23, 2016 Massachusetts Division of Fisheries and Wildlife “Walking Trails Policy” which states their intention to keep MassWildlife properties in a natural state, in light of the possibility that the “Thoreau Trail” might bisect the Bolton Flats Wildlife Management Area.

<sup>172</sup> For example, the Town of Groton efforts to plan and implement an Intensive Archeological Survey on Surrenden Farm, as there are known cultural resources of moderate archeological potential therein consisting of historic period features including standing structures, cellar holes, stone walls, field drainage systems and other remains of the past not yet located and analyzed. “Surrenden Farm Resource Management Plan DRAFT,” (October 2016) page 24.

## CHAPTER 5: POST-DESIGNATION

### Town Votes and Next Steps

In the spring of 2018, the eleven participating towns will vote at their Annual Town Meetings on essentially the same warrant article.

In New Hampshire, the towns of Brookline and Hollis will vote on the following warrant article:

"To see if the town will accept the locally developed River Stewardship Plan drafted by the Nashua River Wild and Scenic Study Committee and its recommendation that that portion of the Nissitissit River flowing through {Brookline}{Hollis} be designated a Wild and Scenic River with the understanding it would not involve Federal acquisition or management of lands."

In Massachusetts, the towns of Ayer, Bolton, Dunstable, Groton, Harvard, Lancaster, Pepperell, Shirley, and Townsend will vote on the following warrant article:

"To see if the town of X\_\_\_\_ will accept the Nashua, Squannacook and Nissitissit Rivers Stewardship Plan developed by the Wild and Scenic Study Committee, together with its recommendation to seek national Wild and Scenic River designation."

If the town votes are affirmative, legislation will be submitted to Congress. For the rivers to be designated, the US Congress must pass the legislation and the President of the United States must sign it. Once designation occurs, the Study Committee will begin to morph into a Stewardship Council, as defined in the following section.

### Post-Designation Stewardship Council

Following designation, the Nashua, Squannacook, and Nissitissit Rivers Wild and Scenic Stewardship Council (Stewardship Council) will succeed the Study Committee and continue its efforts to create a participatory and cooperative stewardship framework.

### Organizational Structure

The purpose of the Stewardship Council is to promote the long-term protection of the Nashua, Squannacook, and Nissitissit Rivers by:

- Bringing together on a regular basis various parties responsible for river stewardship.

- Facilitating coordination among them.
- Providing a focus and a forum for all river interests to discuss and make recommendations regarding issues of concern.
- Coordinating implementation of the Nashua, Squannacook, and Nissitissit Rivers Stewardship Plan.

The Stewardship Council will ensure that there is communication among all partners in the protection of the designated sections of the Nashua, Squannacook, and Nissitissit Rivers, and will provide a forum for discussion of river issues, priorities, and proposed actions.

The Stewardship Council will be the principal entity devoted to the implementation of the Nashua, Squannacook, and Nissitissit Rivers Wild and Scenic Stewardship Plan, and will establish priorities, work plans, action plans, and similar strategies to advance implementation of the Plan.

## **Advisory Function**

The Stewardship Council will work to complement and support the roles and activities of partners working to implement the Stewardship Plan. It will *not* have regulatory authority. It will act as an advisor to existing entities that have management or regulatory authority on the rivers, including the individual member entities of the Stewardship Council. The Stewardship Council may undertake projects directly or sponsor projects in partnership with its individual member entities and partners.

## **Responsibilities**

The Nashua, Squannacook, and Nissitissit Rivers Stewardship Council will have the following responsibilities:

- Meet on a regular basis, with all meetings of the Stewardship Council open to the public.
- Develop annual action plans and work plans based on the Nashua, Squannacook, and Nissitissit Rivers Wild and Scenic Stewardship Plan and the priorities set by the Stewardship Council to advance those work plans.
- Establish the approach and/or metrics for evaluation and assessment of progress towards its goals.

- Report annually to the member entities of the Stewardship Council on Council activities, accomplishments, and plans.
- Advise the National Park Service, participating member communities, and state and federal agencies, as well as other stakeholder entities, regarding issues and concerns related to the Nashua, Squannacook, and Nissitissit Rivers.
- Periodically review the Stewardship Plan and consider revisions and updates as appropriate. (See “Revision of the Plan” below.)

## **Establishment**

If the participating towns vote at Town Meetings to accept the Stewardship Plan and its recommendation to seek designation, the Nashua River Wild and Scenic River Study Committee intends to remain active until designation is achieved. Once designation occurs, the Stewardship Council will be established. This will provide continuity and continued momentum between the completion of the study process and a formal designation. It demonstrates the high level of partner commitment to the long-term protection of the rivers.

With the continued presence of the Study Committee while pursuing designation, a number of actions recommended in the Stewardship Plan can be undertaken without delay, through local participation and volunteerism. In the event of no designation, the Plan will be a significant asset for planning and stewardship.

## **Membership**

The Stewardship Council will consist of not more than 15 voting member entities. Core member entities will include the participating towns of Ayer, Bolton, Brookline, Dunstable, Harvard, Hollis, Groton, Lancaster, Pepperell, Shirley, and Townsend; the Nashua River Watershed Association; and the National Park Service. Each core voting member entity will have one vote. Two additional voting member entities may be elected by the core membership from not-for-profit or government entities that the Council feels will provide specialized knowledge and expertise to support the work of the Council.

## **Appointments**

Each voting member entity will be encouraged to appoint one Representative and one Alternate. As stated above, each entity shall have only one vote. Appointments shall be made

by each entity as appropriate, and are expected to be as follows, Boards of Selectmen (for towns); Regional Director or designee (for National Park Service); Boards of Directors or designee (for non-profits); and Division Director and/or District Supervisor or designee (for Massachusetts or New Hampshire Divisions or Departments).

## **Terms**

It is recommended that Stewardship Council members be appointed for three years, if that length of time is compatible with the rules of the appointing entity. Stewardship Council members may be reappointed to serve additional terms.

## **Conflict of Interest**

All Stewardship Council members will be required to fill out a Conflict of Interest form and follow conflict of interest laws as applicable.

## **Suggested Appointees**

Appointees to represent the voting member entities could be selected from members of local government boards, riverfront landowners, local experts about a specific outstanding resource, and those who would provide active and informed committee representation.

## **Advisory Committee**

The Stewardship Council may also form a non-voting Advisory Committee whose members may participate in committee deliberations without a vote. Members of the Advisory Committee might include representatives from:

- Devens, an Enterprise Zone, represented by the Devens Enterprise Committee
- Commonwealth of Massachusetts (for example, Division of Fisheries and Wildlife, Northeast and Central Districts; and, Division of Ecological Restoration)
- State of New Hampshire (for example, Fish and Game Department)
- US Fish and Wildlife Service (for example, Refuge Manager, Oxbow National Wildlife Refuge)
- US Geologic Survey

- Companies that own the three working dams (Hollingsworth and Vose Company; Ice House Partners, Inc./Grady Research, Inc.; and Eagle Creek Renewable Energy, LLC)

## **Additional Participants**

Throughout the implementation of the Stewardship Plan, the Stewardship Council will stay in close touch with a wide variety of stakeholder groups and entities, some of whom may choose to attend regular meetings of the Stewardship Council. Such entities include, but are not limited to: Nashoba Paddler, LLC; Squann-a-tissit Chapter of Trout Unlimited; Ducks Unlimited; bass fishing clubs and local sportsmen groups; Regional Planning agencies; Massachusetts Department of Transportation and New Hampshire Department of Transportation; local and regional land trusts; conservation organizations such as Massachusetts Audubon, Massachusetts Rivers Alliance, and Beaver Brook Association; trail groups; Freedom's Way Heritage Association; historical societies; local Sustainability Commissions; and others.

## **Procedures**

**Decision Making.** The Stewardship Council will endeavor to act by consensus whenever possible. Formal votes may be taken from time to time at the discretion of the Chair or by request of any member. On the occasions when votes are needed, a 2/3 vote of the formal voting member entities present is required to pass. *Roberts Rules of Order* will be followed.

**Quorum.** A quorum at any meeting of the Stewardship Council is 51% of the formal voting member entities.

**Officers.** The Stewardship Council shall elect a Chair and a Vice-Chair on an annual basis. Other officers may be elected by vote of the Stewardship Council, such as Treasurer and Secretary. The National Park Service shall not be eligible to hold any officer position of the Council, and only town-appointed members may serve as Chair and Vice Chair.

**Policies and Procedures.** The Council may choose to develop detailed policies and procedures that expand upon the administrative provisions of this Plan. Such expanded policies and procedures shall be consistent with the intent and provisions of this Plan.

**Revision of the Stewardship Plan.** The Stewardship Council shall conduct a thorough review of the Stewardship Plan and its recommendations at least every five years. If and when the

Council determines that meaningful annual action plans cannot be developed consistent with the parameters of the existing plan, or a significant change of some sort needs to be made, the Council should undertake a revision.

When the Stewardship Council does a review of the Plan, it will include an assessment of whether the Plan is providing sufficient guidance regarding actions that can and should be taken on the tributaries of the designated rivers to protect their river-related ORRVs.

Furthermore, it is the recommendation of the current Nashua River Wild and Scenic River Study Committee that the future Stewardship Council give careful consideration as to whether there are additional segments of the designated rivers, their tributaries, and their headwaters that might merit a future effort to seek expansion of Wild and Scenic Rivers designation.

Examples include, but are not limited to, the North Nashua River.

## **Funding/Staff**

The Stewardship Council will be responsible to secure funding for its work and staffing. Member entities will not be assessed or responsible for funding. That said, it is anticipated that the National Park Service (NPS) will provide a basic level of staff support and funding to the Stewardship Council and its operations through the National Wild and Scenic River Designation, dependent upon congressional appropriations.

It is likely that the NPS may enter into a Cooperative Agreement with an incorporated member entity of the Council—as was done during the Study through the Nashua River Watershed Association—as the vehicle through which to provide such funding and staff support.

Cooperative Agreements are formal written agreements between NPS and a local partner to create the ability to designate federal funding or other federal assistance for supporting the implementation of the Stewardship Plan. The local partner would act, in essence, as the fiscal agent for the Stewardship Council and NPS. It is not anticipated that the NPS could enter into Cooperative Agreements directly with the Stewardship Council as an entity, as it lacks the sufficient legal foundation. It has been typical of Partnership Wild and Scenic Rivers in New England for the Cooperative Agreement to be established with a local non-profit organization, such as a land conservation group or a watershed association. Decisions about how available funding is to be spent are made by the Stewardship Council.

## **Roles of the Partners**

**Towns.** The Stewardship Plan calls for each town to be an active, voluntary participant in the Stewardship Council and in stewarding the ORRVs. As described above, each town will appoint a member and alternate to represent their interests and be responsible for communication between the town and the Council. It is expected that the Conservation Commissions and Planning Boards will continue to play important roles.

**Nashua River Watershed Association.** The Nashua River Watershed Association (NRWA), nearing the 50<sup>th</sup> anniversary of its founding, offers comprehensive knowledge of local issues associated with the ORRVs and has been working actively to steward them. The NRWA played a coordinating role in the Study Committee, and is available to play a similar role in the Stewardship Council if Council members so desire. The NRWA will appoint a member and an alternate to the Council.

**National Park Service.** If the Wild and Scenic River designation occurs, the NPS will coordinate any funding that is authorized by Congress for use in implementing the Management Plan. The NPS will take an active role on the Stewardship Council, and, as funding allows, provide staff support and technical advice.

In addition, the NPS will represent the Secretary of the Interior in fulfilling the legislative mandates of the Wild and Scenic Rivers Act: the NPS will review proposed projects that require a federal permit or use federal funding. Any such projects will be evaluated for consistency in protecting and enhancing the ORRV's, which make the rivers appropriate as components of the Wild and Scenic Rivers System.

There are no new regulatory permits associated with the designation. NPS conducts its reviews through existing federal regulatory programs, such as permitting under the Clean Water Act by the US Army Corps of Engineers or the US Environmental Protection Agency, and through the processes required by the National Environmental Policy Act, which provides for environmental impact reviews of proposed federal actions.

**Commonwealth of Massachusetts and State of New Hampshire.** Both states have departments that are active in managing water quality, supporting open space conservation, planning roads, and interfacing in innumerable ways with the anticipated activities of the Stewardship Council.

**Landowners.** There are no new regulations or rules associated with designation that impact private landowners. Private landowners, especially riverfront landowners, will be kept informed through a variety of means regarding the activities of the Stewardship Council, the many avenues to offer input, and ways in which they can help steward the ORRVs.

**Dam Owners.** The owners of the Hollingsworth and Vose Dam, the Ice House Dam, and the Pepperell Dam are important stakeholders. Over the years, they have partnered with member entities of the Study Committee on impactful projects benefitting the ORRVS, such as riverbank restoration and management of aquatic invasives. Their continued partnership will be important to the success of the Stewardship Plan.

**Other Stakeholders.** There are many other engaged stakeholders, as the list of entities who offered input and support attests, and they each will play an important voluntary role in stewarding the ORRVs as we go forward.

## **What if Designation Does Not Occur**

If designation never occurs, this Stewardship Plan can nonetheless serve as a blueprint for how the local towns and stakeholders can work together to maintain and enhance the Outstandingly Remarkable Resource Values of the rivers. That said, in the opinion of the current Study Committee, it would be enormously beneficial for the rivers to be designated as Partnership Wild and Scenic Rivers and to be eligible for federal funding and assistance to work in partnership to steward these spectacular rivers for generations to come.

## APPENDIX A: Dams

Two historic run-of-river hydropower dams—“working dams”—are located on the reach of the Nashua River proposed for designation: Ice House Dam in Ayer, owned by Ice House Partners, Inc. and Pepperell Dam in Pepperell, Massachusetts, owned by Pepperell Hydro Co.

On the Squannacook River, there is one working run-of-river dam owned by Hollingsworth and Vose in West Groton, and four non-working historic run-of-river dams, including: the Squannacook Dam in West Townsend and the Townsend Dam, Adams Dam, and Mason Road Dam in Townsend.

The Turner Dam on the Nissitissit River was removed in 2015 with federal, state, local and private funding and partnerships. The only other dam on the Nissitissit, the Guarnottas Dam, is breached; only remnants remain below the waterline.

All of the existing dams have important historical and cultural values deeply rooted in the history of the communities and their early development.

### Working Dams

#### Pepperell Dam

The first paper mill was established at the site near the current Pepperell Dam in either 1834 or 1835.<sup>173</sup> Historical documents indicate the first dam was built at Babbitasset Falls (on the Nashua River) in the early 1860s. The location and layout of the dam changed over the years, and the current dam and powerhouse were built in 1920 by the Pepperell Paper Company.<sup>174</sup> The Pepperell Paper Company closed in the early 2000s, and Pepperell Hydro Company, LLC (PHC) purchased the property in 2004. The power plant was grandfathered for operation under the Federal Energy Regulatory Commission (FERC) until upgrades were begun in 2007 by PHC, triggering the need for a FERC license.

At the request of the NPS, the PHC project area was excluded from the Nashua River Wild and Scenic Rivers Study Act, so as not to have the Wild and Scenic project efforts interfere with PHC obtaining a FERC license. Subsequently, the NPS confirmed to FERC by letter dated July

---

<sup>173</sup> Pepperell “History of the Town,” <http://www.town.pepperell.ma.us/131/History-of-the-Town>.

<sup>174</sup> Pepperell Hydro Company, LLC; FERC Order Issuing Original License Project, P-12721-006, Sept. 8, 2015.

17, 2015 that the licensing of the Pepperell Project would not be in conflict with the Wild and Scenic River Study. PHC received a FERC license in 2015 (FERC Project Number P-12721), and in 2016 PHC was sold to Eagle Creek Renewable Energy (retaining PHC name for the project).

The dam operates as run-of-river (outflow from the project equals inflow at all times) and is 23.5 feet high, with 3 foot high flashboards, and is 251 feet long. Flow from the Nashua River flows through a gated intake structure to a 565.5 foot-long penstock. Pepperell Hydro releases a minimum flow of 15 cubic feet per second (cfs) or inflow (whichever is less) into the bypassed reach over the spillway year round. The project includes a partially constructed permanent downstream passage facility for river herring.<sup>175</sup> A Recreational Plan for the dam project area has been accepted by the FERC, and will include canoe and kayak portage areas around the dam as well as new parking facilities for paddlers. The FERC licensing requires eel passage and fish passage facilities, once enough anadromous fish have reached the dam from downriver.

There are numerous cultural, recreational and scenic values associated with the river above and below the Pepperell Dam. These include the Nashua River Rail Trail, which follows the river on the east side; J. Harry Rich State Forest, which also abuts the river on the east; the historic Covered Bridge downriver from the dam; and the Petapawag Conservation Area and boat launch in Groton. Each year, approximately 1,200 students and adult chaperones paddle the Nashua River in the dam project area as part of the Nashua River Watershed Association's River Classroom® activities. The river is the site of numerous yearly bass fishing tournaments, and is a popular destination for hunting waterfowl. Thousands of canoeists and kayakers take to the river to enjoy the quiet and scenery, and it is a destination for birders to witness osprey and bald eagles fishing the river.

Challenges upriver from the dam include the nearly one hundred acres of invasive water chestnut plants and four other invasive aquatic plants that have taken hold there. As part of the FERC licensing for the dam, PHC reached a Settlement Agreement with Stakeholders and is

---

175 ibid

providing funding to address the invasive plants through the established Nashua River Regional Aquatic Invasives Alliance.

The Study Committee and the National Park Service (consistent with the NPS letter of 7-2015) deem the facility as compatible with a wild and scenic designation as currently licensed and operating. The NPS Report to Congress will further document this finding. As such, the Pepperell Project will effectively be “grandfathered” as concerns the Wild and Scenic River designation, and the NPS will recommend a technical “exclusion” area be incorporated into the designation legislation to further codify this. This will in no way hinder the post-designation Stewardship Council from working cooperatively with Pepperell Hydro Company to protect and enhance river values consistent with the intent of the Stewardship Plan, including maintaining and improving river access, controlling invasive plants in the area above the dam, preventing migration of invasive plants below the dam, and otherwise enhancing the already remarkable values associated with the river into the future for the benefit of public use.

## **Ice House Dam**

The first dam at the current site of Ice House Dam dates back to the 1790s. The dam was used as a reference marker in laying out the towns, probably due to the rock outcrop in the riverbed, which served to anchor the dam.<sup>176</sup> In 1907, a powerhouse was built to power trolley cars, and ice production began in the 1920s. Power production for ice manufacturing was stopped mid-century when refrigerators became popular.

Ice House Partners, Inc. restored the hydropower facility in the early 2000s, and received a FERC license exemption in 2008 (FERC Project Number P-12769).<sup>177</sup> The facility is operated as run-of-river, and consists of a 190 foot-long, 12-foot high dam topped with 24-inch stoplogs. The Nashua River reach that is bypassed by operating the project (measured from the dam to the tailrace outlet) is about 300 feet long. A million gallon per day flow to the Nashua River is maintained in the bypassed reach year-round.<sup>178</sup>

<sup>176</sup> Low Impact Hydropower Institute Certificate #44—Ice House Hydropower Project, Massachusetts, <http://lowimpacthydro.org/lihi-certificate-44-ice-house-hydropower-project-massachusetts-ferc-12769/>.

<sup>177</sup> Federal Energy Regulatory Commission, 122 FERC 62,262, Order Granting Exemption From Licensing, <https://lowimpacthydro.org/assets/files/lihi-cert-app-files/APPENDIX-OrderGrantingExemption.pdf>

<sup>178</sup> ibid

The Ice House project lies fully within the Oxbow National Wildlife Refuge. The river immediately up and down from the dam is riverine in nature, and affords paddlers and anglers every opportunity to enjoy the serene benefits of the Nashua River within the ONWR. Ice House Partners maintains a canoe put-in and take-out and fishing access on the opposite side of the river from the project works. Eel passage is maintained for elvers traveling upriver, but fish passage has not been required at the facility due to the existence of downstream fish blockages at other dam projects. The NRWA has hosted canoe and kayak-guided hand-pulls of small patches of invasive water chestnut plant upriver from the dam the past three years, which has nearly eliminated the plant from the reach.

The Study Committee and the National Park Service deem the facility as compatible with a Wild and Scenic designation as currently licensed and operating. The NPS Report to Congress will further document this finding. As such, the Ice House Project will effectively be “grandfathered” as concerns the wild and scenic river designation, and the NPS will recommend a technical “exclusion” area be incorporated into the designation legislation to further codify this. The exclusion area begins 700’ upriver of the dam and concludes 500’ downriver of the dam. The exclusion area for Ice House dam is proposed to be approximately 500 feet downriver from the dam (latitude 42.55325; longitude -71.61735), and approximately 700 feet upriver to the shore of the impounded area (latitude 42.55185; longitude -71.62135). This will in no way hinder the post-designation Stewardship Council from working cooperatively with Ice House Partners to protect and enhance river values, consistent with the intent of the Stewardship Plan, including maintaining and improving river access, controlling invasive plants in the area above the dam, and otherwise enhancing the already remarkable values associated with the river into the future for the benefit of public use. The dam is deeded to Ice House Partners, Inc. and includes historical water rights, which will not be extinguished, impaired or interfered with by this designation.

### **Hollingsworth and Vose Dam**

The West Groton village, known as the Hollingsworth and Vose (H&V) area mill village, was originally the site of a Federal Period starch mill. Paper manufacturing began at the site before

the original mill burned in 1846, and continues today.<sup>179</sup> The village, consisting of the mill and approximately 20 houses, grew up around this industry.

H&V is now a specialty filter paper manufacturing company. The company maintains a small impoundment for process water. The dam was first constructed in the 1840s for the previous starch factory, but no original construction records are available. The dam's hydraulic height is 15 feet, and is 225 feet long, with the impounded volume of 350 acre-feet. Each year, 15-inch flashboards are installed in May and removed again in November. Water is withdrawn from the impounded area, and returned to the river downstream through a water treatment facility. H&V holds a National Pollutant Discharge Elimination System (NPDES) permit for this discharge.

Upriver of the dam, the H&V impoundment provides access to the Squannacook River for the NRWA's River Classroom® activities. Over 1,100 students and adult chaperones each year paddle north from the impoundment to learn about the natural environment of the Squannacook River and its environs.

The Study Committee and the National Park Service deem the facility as compatible with a Wild and Scenic designation. The NPS Report to Congress will further document this finding, and although this project is not licensed by FERC, it does have a federal permit in the form of its NPDES discharge permit. As such, the H&V dam, together with its NPDES permit, will effectively be "grandfathered" as concerns the Wild and Scenic River designation, and the NPS will recommend a similar technical "exclusion" area be incorporated into the designation to further codify this. The exclusion area for H&V dam is proposed to be approximately 2,665 feet downriver from the dam (latitude 42.60791; longitude -71.63240) and approximately 1,200 feet upriver to the shore of the impounded area (latitude 42.61421; longitude -71.63899). This will in no way hinder the post-designation Stewardship Council from working cooperatively with H&V to protect and enhance river values consistent with the intent of the Stewardship Plan into the future for the benefit of the public.

## **Non-Working Dams**

All the dams described below are run-of-river dams with no active current use.

---

179 Groton Historical Commission, <http://books.gpl.org/GPLDL3/HollingsworthVoseAreaFormA.pdf>.

## **Townsend Dam**

Dams have been recorded on this site back to the 1730s. The adjacent building called the Cooperage was built in 1733 as a mill for sawing boards.<sup>180</sup> An historic gristmill is located at the site. The current dam, owned by Hollingsworth and Vose, was constructed in the 1870s and has no current active use. The dam's hydraulic height is 8.3 feet and its length is 93 feet.

The impoundment created by the dam is Harbor Pond, which is the end-point for the Squannacook River Canoe Race held each year by the Townsend Lions Club. Paddlers can maneuver up the Squannacook River above the dam, or put in below the dam and paddle down to Bertozzi Wildlife Management Area. The Squannacook River is a popular coldwater fishery. Groundbreaking for the Squannacook River Rail Trail will be held in 2018–2019, which will run alongside the river for three miles.

## **Squannacook River Dam**

Straddling the Groton-Shirley line in West Groton, this dam powered the former Groton Leatherboard Company. Currently having no active use, the dam is maintained by the Town of Groton. The dam is approximately 150 feet long and 18 feet high. It includes a concrete spillway on the left side that leads to a concrete outlet works.<sup>181</sup> A low-level wooden outlet structure about 40 inches square is operated once each year, and is generally kept a couple of inches. River Court Residences, a senior housing facility, abuts the dam on the eastern downriver side.

## **Adams Dam**

The run-of-river Adams dam was built in the early 1800s, and was used by Adams Mill. A mill building was present on the site until the 1970s, when it was torn down. The dam is currently owned by the Town of Townsend.

## **Mason Road Dam**

The Mason Road run-of-river dam was built in the early 1800s or earlier, and has no current active use. The stone dam is approximately 7.5 feet high. A 1915 Report to the Board of Water

180 Townsend Historical Society Properties, <http://www.townsendhistoricalsociety.org/properties.html>.

181 Squannacook River Dam Phase I Inspection/Evaluation, Haley & Aldrich, for the Town of Groton, October 17, 2017.

Commissioners of the City of Fitchburg, Massachusetts mentions this dam was no longer in active use at that time.<sup>182</sup>

### **Non-working Dams Recommendation**

These non-working run-of-river dams need not be excluded from the proposed designation, because they have little impact on the free-flowing character of the river and have important historical character that contributes to the proposed Wild and Scenic River designation. No federal permits or licenses exist related to these facilities. The Wild and Scenic River designation would not inhibit the maintenance and/or repair of these structures, nor would it inhibit dam removal in the event that a dam owner chose to pursue such removal. Any dam removal consideration must be consistent with state dam removal guidance and local interests.

## APPENDIX B: Regulatory Review

### STATE REGULATIONS FOR RESOURCE PROTECTION

This chapter is a snapshot review of existing laws, regulations, programs and policies in Massachusetts and New Hampshire that enable and inform planning and resource protection efforts in the towns within this Stewardship Plan. It is designed to be useful as an information resource to communities and the future Stewardship Council.

Municipalities have important regulatory powers authorized under state laws governing land use that impact water quality and habitat. These include the framework to produce local Master Plans and Open Space Plans, as well as authority to adopt local bylaws include those addressing zoning, subdivision, Low Impact Development (LID), and wetlands.

#### Wetland Protection

The **Commonwealth of Massachusetts**, through its Wetlands Protection Act, Massachusetts General Law Chapter 131 Section 40, regulates all activities within a 100-foot buffer zone to all wetlands as defined in the Act. These include “*...bank, riverfront area, fresh water wetland, coastal wetland, beach, dune, flat, marsh, meadow, or swamp bordering on the ocean or on any estuary, creek, river, stream, pond or lake, or any land under said waters of any land subject to tidal action, coastal storm flowage, or flooding.*”

The **Rivers Protection Act** protects all land within 200 feet of the high water mark of rivers and perennial streams. Isolated lands subject to flooding greater than one-quarter acre with a water depth of six inches are also protected. The Massachusetts **Wetlands Protection Act** identifies eight interests, which ideally all projects proposed within wetland resource areas must meet:

1. Protection of public and private water supplies
2. Protection of groundwater
3. Flood control
4. Prevention of storm damage
5. Prevention of pollution
6. Protection of land containing shellfish

7. Protection of wildlife habitat
8. Protection of fisheries

Home Rule powers under Article 89 of the Massachusetts Constitution have allowed more than half of Massachusetts's 351 cities and towns to adopt general (non-zoning) local wetland bylaws or ordinances. These bylaws and ordinances give Conservation Commissions further power to protect wetlands through enhanced buffer zones and other means.

The State of New Hampshire, on the other hand, has no statewide official buffer zone, although its Department of Environmental Services has a Wetlands Bureau that regulates activities in wetlands themselves. The New Hampshire legislature, through Revised Statutes Annotated RSA 482-A, allows municipalities to adopt local wetland protection ordinances, which can include provisions for buffer zones of various widths to provide additional protection above and beyond that afforded by the State. About 84 New Hampshire cities and towns have local wetland protection ordinances.

Since towns in both states can adopt local wetland protection bylaws and ordinances, the question then arises as to what width a buffer zone should be. Several studies have been conducted through the years to determine just how wide a buffer zone needs to be to protect certain values and functions of wetlands. These studies have shown that different wetland values and functions require buffer zones of varying width. For instance, in order to filter out sediments and pollutants that would reach water bodies, wetlands may require a modest buffer zone of only 50 to 100 feet.

In order to protect the widest possible diversity of wildlife species that breed and live in wetlands, including amphibians that breed in wetlands but spend part of their life cycle in adjacent uplands, a wider buffer zone up to 700 feet wide is recommended. However, as such extremely wide buffers are often difficult to implement in many towns, the general practice is that a buffer of 100 feet provides a good deal of protection to wetlands and their associated wildlife habitat functions, while being a reasonable width to regulate.

In both Massachusetts and New Hampshire, the local Conservation Commissions are on the front lines of wetlands protection. In New Hampshire, their function is more advisory, whereas in Massachusetts they have the ability to issue permits for activities in and adjacent to

wetlands. In both states, the Conservation Commissions are likely to draft local wetland protection bylaws and ordinances, although adoption requires approval of Town Meeting.

In each town, the Conservation Commission must weigh the environmental threats to wetlands against the political will to protect them. Some towns have public support for a reasonably wide buffer zone, whereas in others that is currently politically impractical. In the latter case, the Conservation Commission can set out to educate citizens on the important functions of wetlands and their contribution to our quality of life. Once people fully understand how valuable wetlands are, they are more likely to vote to approve a local wetlands bylaw or ordinance that provides more protection than state law provides.

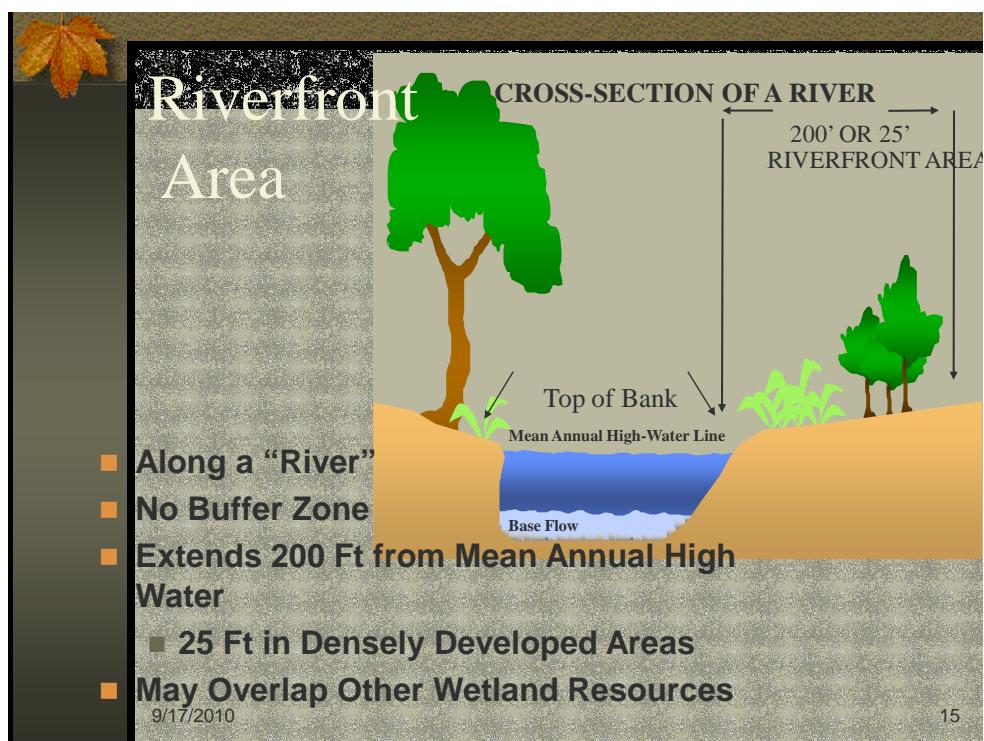

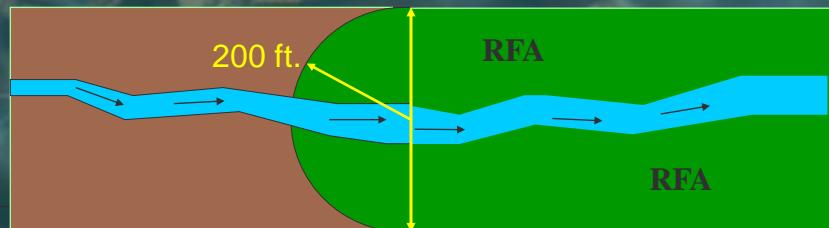

## River and Shoreland Protection

In the Commonwealth of Massachusetts, the **Rivers Protection Act** (RPA), Chapter 258 of the laws of 1996, protects the shoreland areas along rivers and streams. The RPA creates a 200-foot wide riverfront area that extends along both banks of perennial rivers and streams. In certain urban areas where it is recognized that a natural buffer is no longer possible, a riverfront area of 25 feet has been designated.

The RPA does not set up a new permitting process or reviewing authority, but is administered by local Conservation Commissions and the Massachusetts Department of Environmental Protection, under the same procedures as the Wetlands Protection Act. Projects proposed within the riverfront area must meet the eight (8) purposes of the Massachusetts Wetlands Protection Act, which are listed in the preceding discussion of wetlands. The following figures illustrate the jurisdictional areas under the Massachusetts Rivers Protection Act.

## Riverfront Area - Definition, Critical Characteristics, and Boundaries

At the point where a stream becomes perennial, the riverfront area begins at a line drawn as a semicircle with a 200 foot radius around the point and connects to the parallel line perpendicular to the mean annual high-water line which forms the outer boundary.

Figures 1 & 2 Riverfront areas in the Massachusetts Rivers Protection Act.

Source: Philip Nadeau, Massachusetts Dept. of Environmental Protection

In Massachusetts, the 1975 **Squannacook and Nissitissit Rivers Sanctuary Act** provides some additional protection to land adjoining those rivers in several of the participating towns in

Massachusetts. The Act prohibits direct discharges of pollutants and stormwater into the waters of the two rivers. The short text of the act (MA Gen Law Chap. 132A § 17) follows:

**Section 17.** There is hereby established in the towns of Ashby, Groton, Pepperell, Shirley, Townsend and Lunenburg a protected area to be known as the Squannacook and Nissitissit Rivers Sanctuary. Said Squannacook and Nissitissit Rivers Sanctuary shall be comprised of the waters of the Squannacook River and its tributaries, to wit: Ash swamp, Ashby reservoir, Bayberry Hill Brook, Bixby Brook, Flat pond, Flat Pond Brook, Fitchburg reservoir, Locke Brook, Mason Brook, Pearl Hill Brook, Pumpkin Brook, Trap Fall Brook, Trout Brook, Walker Brook, Willard Brook, Witch Brook with the exclusion of that section of the Squannacook River from the Hollingsworth and Vose Dam at West Groton located approximately North 42° 36" 45", West 71° 38" 7", on the U. S. Geological Survey map Shirley quadrangle to the confluence of the Nashua River; and the waters of the Nissitissit River and its tributaries to wit: Coon Tree Pond, Gulf Brook, Heald Pond, Mine Brook, Pork Barrel Pond, Park Barrel Pond Brook, Stewart Brook, Sucker Brook, Wolf Brook.

After the effective date of this act, no new discharge of treated or untreated sewage or other wastewater will be permitted to be discharged to the Squannacook and Nissitissit Rivers Sanctuary. For the purpose of this section, sewage shall mean the water-carried waste products or discharges from human beings, sink wastes, wash water, laundry wastes and similar so-called domestic waters; wastewater shall mean sewage, liquid or water-carried waste products or discharges from human beings, sink wastes, wash water, laundry wastes and similar so-called domestic wastes, and also sewage, liquid or water-carried waste from industrial, commercial, municipal, private or other sources; and person shall mean any individual, association, partnership, corporation, company, business, organization, trust, estate, the commonwealth or any political subdivision thereof, any administrative agency, public or quasi-public corporation or body or any other legal entity or the legal representatives, agents, or assignees thereof.

No person shall install or construct, or cause to be installed or constructed, any new outfall, drainage pipe, ditch, channel or other conveyance to carry stormwater runoff, either directly or indirectly from any structure, parking lot, or storage yard, other than from a one- or two-family residence and appurtenant parking and storage facilities, into the Squannacook and Nissitissit Rivers Sanctuary or any tributaries thereof until plans have been approved by the planning board and conservation commission of the affected town in which the pipe, ditch, channel or other conveyance is located.<sup>183</sup>

Said town may require the construction of any structure or structures or treatment works which it deems necessary to prevent the pollution of the Squannacook and Nissitissit Rivers Sanctuary by matter carried by such storm water runoff.

The attorney general shall take such action as may be necessary from time to time to enforce the provisions of this section. The superior court shall have jurisdiction in equity to enforce the provisions of this section.

---

183 Massachusetts Gen Law Chap. 132A § 17.

In New Hampshire, the **Comprehensive Shoreland Protection Act** (CSPA), RSA 483-B, is the State's regulatory approach to shoreland protection. It applies to all streams of fourth order<sup>184</sup> and greater, designated rivers, tidal waters and lakes, ponds and impoundments over 10 acres. The State maintains a directory of water bodies that are subject to the CSPA.

The CSPA applies to all development and land-use activities within 250 feet of the water's edge or the high water mark, which is called the "reference line." This entire 250-foot wide area is termed the protected shoreland. Within this protected shoreland, levels of protection vary, depending on the distance between the proposed impact and the reference line.

The most restrictive area is the "waterfront buffer," which extends from the reference line 50 feet landward. Within this zone, a natural buffer of native vegetation and natural ground cover must be maintained, with only minimal disturbance allowed. The next area out is the "natural woodland buffer," which must maintain a certain percentage of native vegetation and natural ground cover between 50 and 150 feet from the reference line. In order to determine the quantity of trees to remain within the waterfront buffer, the State has developed a point system that applies different scores to trees based on their diameter at breast height. A description of how this point system works can be found at the linked documents below. Between 150 and 250 feet of the reference line, there are no limitations on vegetation removal.

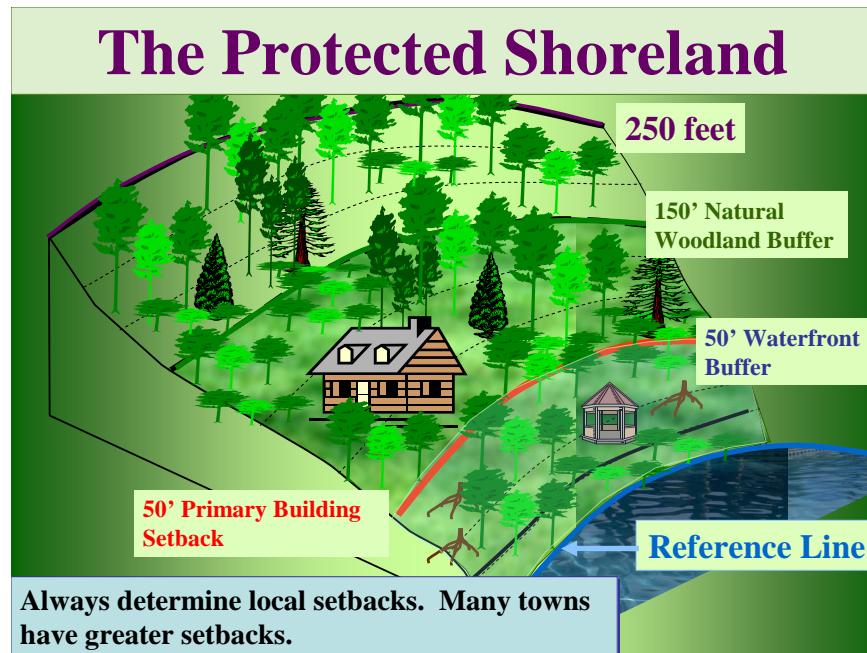

The CSPA places restrictions on impervious surfaces, lot subdivision, excavation, and filling within the protected shoreland. Lots may not have greater than 30% impervious cover.

Developments proposing more than 20% impervious surfaces must install a stormwater management system to the satisfaction of the State. The guidance document prepared by the New Hampshire Department of Environmental Services (NH DES) emphasizes low-impact development (LID) systems as the preferred stormwater management methodology. The New Hampshire DES recently published an environmental fact sheet detailing how vegetation must be maintained within the various areas of the protected shoreland:

<http://des.nh.gov/organization/commissioner/pip/factsheets/sp/documents/sp-5.pdf>

---

<sup>184</sup> Stream order is a measure of the relative size of streams. The smallest tributaries are referred to as first-order streams, while the largest river in the world, the Amazon, is a twelfth-order waterway. First- through third-order streams are called headwater streams.

*Figure: Jurisdictional areas in New Hampshire Comprehensive Shoreland Protection Act.*

*Source: Jay Aube, Shoreland Protection Specialist, New Hampshire DES.*

In addition to the Comprehensive Shoreland Protection Act, New Hampshire also has a **Rivers Management and Protection Program**, which was established in 1988 with the passage of RSA 483 to protect certain rivers, called designated rivers, for their outstanding natural and cultural resources. The program is administered by New Hampshire DES. More information on the New Hampshire statute, the Rivers Management and Protection Program, and a list of Designated Rivers can be found at the following URLs:

<http://www.gencourt.state.nh.us/rsa/html/NHTOC/NHTOC-L-483.htm>

<http://des.nh.gov/organization/divisions/water/wmb/rivers/index.htm>

<https://www.des.nh.gov/organization/divisions/water/wmb/rivers/designrivers.htm>

A similar program, called the Lakes Management and Protection Program, is applicable to New Hampshire lakes.

<http://des.nh.gov/organization/divisions/water/wmb/lakes/categories/overview.htm>

## MUNICIPAL REGULATIONS FOR RESOURCE PROTECTION IN THE STUDY AREA

This review summarizes the existing municipal regulations and planning documents in the towns participating in the Nashua, Squannacook, and Nissitissit Rivers Stewardship Plan. It shows how each town addresses the protection of the Outstandingly Remarkable Resource Values (ORRVs) and assesses the town's capacity to enforce and enhance regulatory measures to protect the ORRVs and the river corridors proposed for inclusion in the Nashua River Wild and Scenic River Corridor. Low Impact Development also helps retain and protect natural habitat for native plants and animals. The narrative analyzes the relevant municipal land use regulations, Master Plans, Open Space Plans, Recreation Plans, and other plans and policies of the participating towns.

The following major subjects and aspects of regulatory land-use controls are described for each participating towns:

- a. **Master Planning** - The municipal Master Plan, Open Space and Recreation Plans, and other related pertinent plans.
- b. **Land-Use Controls** - Provisions in municipal zoning bylaws (called ordinances in New Hampshire) and regulations
- c. **Water Resources Zoning and Regulations** – Provisions for local wetland protection and stormwater management.
- d. **Protection of Key Habitat and Natural Communities** – Relevant land protection and natural resource protection.
- e. **Planning Capacity** – The town's resources in terms of a Town Planner or other planning official, Wetland or Conservation Agent or Administrator and other staff, and whether towns have adopted programs, such as the Community Preservation Act in Massachusetts, that can provide some funding for conservation efforts.

### Master Planning

In both Massachusetts and New Hampshire, the municipal Master Plan serves as the framework that supports a town's regulatory measures, goals, and objectives relating to land use and development. Ideally, Master Plans are updated on a regular basis, with ten years

considered the desired interval for assessing whether such Plans or sections of Plans are still current or need to be revised. For purposes of this Stewardship Plan, town **Master Plans** with a chapter devoted to the protection of water resources are considered superior to Plans in which water resources are described more generally under the chapter devoted to Natural Resource protection.

In Massachusetts, but not New Hampshire, towns are required to adopt State-approved “Open Space and Recreation Plans” if they want to be eligible for certain state-funded grant programs for the acquisition and improvement of open space and the development of recreational facilities.

The **Community Preservation Act** (CPA) is a smart growth tool that helps Massachusetts communities preserve open space and historic sites, create affordable housing, and develop outdoor recreational facilities.

CPA allows communities to create a local Community Preservation Fund for open space protection, historic preservation, affordable housing and outdoor recreation. Community preservation monies are raised locally through the imposition of a surcharge of not more than 3% of the tax levy against real property, and municipalities must adopt CPA by ballot referendum. To date, 172 municipalities in Massachusetts have adopted CPA. (See “Where Does CPA Funding Come From?” at [http://www.communitypreservation.org/CPA\\_Funding](http://www.communitypreservation.org/CPA_Funding).)

The CPA statute also creates a statewide Community Preservation Trust Fund, administered by the Department of Revenue (DOR), which provides distributions each year to communities that have adopted CPA. These annual disbursements serve as an incentive for communities to pass CPA.

Each CPA community creates a local Community Preservation Committee (CPC) upon adoption of the Act, and this five-to-nine member board makes recommendations on CPA projects to the community’s legislative body. This report will not describe each committee, but will note which towns have qualified and are participating in these programs as a wider indicator of their conservation-mindedness. (See “Community Preservation Committees - Composition and Duties” at <http://communitypreservation.org/CPCs>.)

## Land-Use Controls

Rather than examine the entirety of the scope of each town's zoning ordinance or bylaw, this Stewardship Plan focuses on those types of zoning and regulations that are most directly related to or can be used to enhance the protection of the ORRVs identified in this Stewardship Plan.

The first zoning tool that is examined is **Open Space Residential Development** (OSRD), also known as Natural Resource Protection Zoning, which is related to older, more basic approaches such as cluster zoning, conservation subdivision, or flexible zoning. Under this variation of subdivision development, a certain percentage of the entire parcel subject to development must be preserved as permanently protected open space, while generally permitting a similar number of housing units to be developed as in a conventional "grid" subdivision.

Over the years, the practice and standards for OSRD have evolved. The amount of open space preserved in early OSRDs was often low, in the range of 25% to 30% of the total tract area, often including large areas of wetlands and other undevelopable areas. The most recent standards for OSRD call for the preservation of at least 50% of the total tract being developed as open space, with no more than 50% of it, sometimes less, allowed to be wetlands or other undevelopable land. The open space areas thus set aside can be linked to other protected land, preserving networks of open space across an entire town or on a regional level.

Early OSRD bylaws usually required that such developments obtain both subdivision and special permit approval, which can be a time-consuming, expensive, and uncertain permitting process for landowners and applicants. As a result, such bylaws often are not utilized for most development. Best practice now calls for OSRDs to be allowed "by right," meaning they are considered a preferred form of subdivision development that need only obtain subdivision approval.

Another important land-use control subject to regulation is development on steep slope areas, usually defined as slopes in excess of 15% or 20%. Development on steep slopes often leads to erosion problems that require expensive engineering solutions to prevent or correct.

Development on slopes also often requires more extensive clearing and grading than

development in more level areas, thereby removing more natural habitat and reducing the capacity of plants and soils to absorb precipitation.

Most towns do not specify a maximum slope for development per se (although some do), but rather limit the percentage maximum slope of roads and driveways, which indirectly helps to minimize development of such steep areas. These maximum permissible road and driveway slopes are often in the range of 10% to 15%. Some towns do a better job of addressing erosion control measures in their subdivision and site plan regulations. In general, the more specific such provisions are, the greater the erosion control.

Another important land use control is the maximum percent of a lot that may be rendered impervious to water. Hard surfaces such as asphalt, concrete, and even hard packed gravel can prevent water from infiltrating into the soil, resulting in rainwater running off the impervious surfaces. The runoff often is contaminated with petroleum products, road salt, pesticides, herbicides, lawn fertilizers, and other pollutants, which are then released into nearby water bodies. Increased imperviousness also reduces recharge of groundwater, which is important to maintain stream flows and water supplies. Reducing impervious surfaces by specifying a maximum lot coverage for buildings and parking lots can help to prevent stormwater runoff, which is now a leading cause of surface water pollution<sup>185</sup> according to the US Environmental Protection Agency. Parking requirements that reduce the number of required parking spaces or allow for shared parking between adjacent lots can also help reduce stormwater pollution.

Many towns have adopted aquifer protection overlay districts to protect their most important groundwater resource areas from pollution. These bylaws often prohibit the most risky land-uses, such as gas stations, underground storage tanks, certain industrial processes, dry cleaning, etc. from being sited over porous sand and gravel deposits (aquifers) that can supply a clean source of public drinking water. For other land uses, such overlay districts require a greater degree of care when building or undertaking certain activities.

As groundwater often supplies a large degree of “baseflow” to rivers and streams, especially in summer, protecting groundwater aquifers can help to safeguard water quality in coldwater streams hosting many of the ORRVs identified in this Stewardship Plan.

---

185 Stormwater Problems and Impacts: Why All The Fuss? <http://riverlink.org/wp-content/uploads/2014/01/stormwaterseriesfinal1.pdf>.

**Floodplain overlay districts** are used to restrict development in low-lying areas subject to flooding or adjacent to rivers and streams in upland areas that can also be subject to flash flooding. While not often prohibiting development outright, such districts can require that any building in a floodplain be elevated above the base flood level and require such buildings to have flood insurance. To prevent aggravated flooding in adjoining areas, filling is generally prohibited in regulated floodplains.

Changes in the hydrological cycle resulting from global warming are leading to a greater number of intense rainfall events in many regions, including New England<sup>186</sup>. It is important that towns make sure they are using up-to-date floodplain maps and stormwater calculations that reflect this new reality. Because the standardized mapping only considers historic flood data, communities should consider including additional safety factors to plan for future flood events.

## Water Resource Zoning and Regulations

In both Massachusetts and New Hampshire, towns can adopt local **Wetland Protection bylaws/ordinances** that supplement and expand upon the protection offered wetlands through the respective State Acts. As New Hampshire does not set a minimum regulatory buffer zone of 100 feet, as does Massachusetts, such bylaws are perhaps of even greater value in that state. However, bylaws are also important in Massachusetts, where the buffer zone is subject to review but not actual protection. Such bylaws can specify no-build and no-disturbance buffers, within which new buildings or disturbances to the land are prohibited within a specific distance to the edge of wetlands. Recent science on the performance of such buffers in protecting both wetlands and surface waters from degradation supports making the buffers as wide as possible, up to several hundred feet in some studies. The summary table and town descriptions provided in this document list the buffers, if any, of each town within the Nashua River Wild and Scenic area.

---

<sup>186</sup> See presentation by David Vallee, Hydrologist-in-Charge of National Weather Service's Northeast River Forecast Center, on the topic of "Climate Trends in New England and Their Impact on Our Rivers" at the 2017 NRWA Annual Meeting at [http://nashuariverwatershed.org/images/pdf/Vallee\\_NashuaRvrBasin\\_Climotalk\\_Nov2.pdf](http://nashuariverwatershed.org/images/pdf/Vallee_NashuaRvrBasin_Climotalk_Nov2.pdf).

**Stormwater management** programs are also a vital part of water resource protection. The leading cause of water pollution today comes not from point sources such as outfall pipes of factories, but from runoff from impervious surfaces such as roads and parking lots, which carry loads of sediment and pollution into surface water bodies. Many of the larger towns within the Nashua River Wild and Scenic area are subject to the Federal National Pollutant Discharge Elimination System (NPDES) Phase II program. As such, they must prepare local stormwater management bylaws as well as institute programs to clean catch basins, inspect for illegal (illicit) discharges, and otherwise educate municipal authorities and the public on how they can help to minimize stormwater pollution.

**Low-Impact Development** (LID) is an approach to development design that minimizes disruption of natural vegetation and soils and maintains water flow and infiltration patterns as much as possible. LID for stormwater management relies predominantly on vegetative approaches, such as rain gardens, as well as the use of natural features and naturalized areas like grassed swales, to both reduce the amount of and treat stormwater runoff. The table and town summaries describe the LID provisions, if any, of each of the participating Wild and Scenic towns.

## **Protection of Key Habitats and Natural Communities**

The protection of key habitats and natural communities is usually addressed at the Master Planning level (including Open Space Plans) and is reflected in each town's efforts to protect the resources thus identified. Identification of such features in local plans is an important first step. Actual protection requires further actions; such as acquisition for conservation purposes or imposition of regulatory protections. The majority of participating towns in both Massachusetts and New Hampshire place a high priority on conservation and the protection of wildlife habitat, even if their regulatory framework currently needs to catch up to the Master Plan goals and objectives.

Various resources to assist with this include BioMap2 and the rare species Priority Habitat maps available by town and periodically updated by the Massachusetts Natural Heritage and Endangered Species Program (NHESP).<sup>187</sup> Note the importance of reporting rare species

---

<sup>187</sup> [www.mass.gov/service-details/ma-endangered-species-act-mesa-overview](http://www.mass.gov/service-details/ma-endangered-species-act-mesa-overview)

observation to NHESP and certifying vernal pools. Advance documentation is required to ensure regulatory jurisdiction.

## **Planning Capacity**

This analysis describes the ability of a town, by having appropriate staff and by participating in programs that provide funding for planning and conservation, to implement the planning and regulatory tools that have been previously mentioned. Having either a full-time or a part-time **Town Planner** greatly enhances a town's ability to implement all types of planning, such as programs related to water resource and wildlife habitat protection. A **Conservation Agent** is someone trained in wetland science and management who assists local Conservation Commissioners with their responsibilities under state and local law. Conservation Agents can also assist their Commissions with identifying high value lands for conservation and in preparing and implementing Open Space and Recreation Plans.

## **TOWN-BY-TOWN REVIEW OF REGULATORY FRAMEWORK**

This section presents a town-by-town narrative description of the municipal regulations in the towns participating in the Nashua, Squannacook, and Nissitissit Rivers Stewardship Plan. It describes the plans, policies, local planning capacity, zoning and regulations, and opportunities for potential improvement for each of the following communities:

- Ayer, Massachusetts
- Bolton, Massachusetts
- Brookline, New Hampshire
- Devens Enterprise Zone, Massachusetts
- Dunstable, Massachusetts
- Groton, Massachusetts
- Harvard, Massachusetts
- Hollis, New Hampshire
- Lancaster, Massachusetts
- Pepperell, Massachusetts

- Shirley, Massachusetts
- Townsend, Massachusetts

## Ayer, Massachusetts

Ayer is a small to medium-size town on the outskirts of the greater Boston area, about 35 miles from Boston, with easy access to interstate Route 495 and Route 2. As of 2016, Ayer's population stood at ~8,119. Ayer is fortunate in being situated on the Boston - Fitchburg Commuter Rail Line, which not only provides a commuting alternative to local residents, but can also serve as an incentive to economic development. The former Fort Devens Army Base abuts the town. Devens has since been turned into an Enterprise Zone and is a regional employment center.

### ***Plans, Policies and Local Planning Capacity***

**Summary of Master Planning.** The town of Ayer is in the process of revising its master planning documents, including the Master Plan itself, as well as its Open Space and Recreation Plan. Approval of both master planning documents is anticipated in early 2018. These Plans will serve as the basis for future planning efforts for many years. Ayer is a designated Massachusetts Green Community<sup>188</sup>.

**Local Planning Capacity.** The town of Ayer has a full-time Planner and a full-time Conservation Administrator. The Town is part of the Montachusett Regional Planning Commission. Ayer was an early adopter of the CPA, which the town approved in 2002. A Community Preservation Committee oversees the acquisition and preservation of open space, the creation and support of affordable housing, the acquisition and preservation of historic resources, and the creation and support of outdoor recreational uses. The Ayer Community Preservation Committee has a mission to maximize the benefits of the CPA funds for the citizens of Ayer.

---

188 “The MA Green Community Designation and Grant Program provides a road map along with financial and technical support to municipalities that 1) pledge to cut municipal energy use by an ambitious and achievable goal of 20 percent over 5 years and 2) meet four other criteria established in the Green Communities Act. The benefits of designation extend beyond the program itself, inspiring cities and towns to undertake additional energy-related initiatives, improve coordination between municipal staff and departments, and increase messaging with the public at large about energy-related issues and actions.” <https://www.mass.gov/guides/becoming-a-designated-green-community>

## ***Zoning and Regulations***

Ayer has an Open Space Residential Development bylaw, which allows this type of development by Special Permit from the Planning Board. It requires that 50% of the total tract area be preserved as permanently protected open space, which is in line with the most recent recommendations from the Massachusetts Executive Office of Energy and Environmental Affairs for this type of bylaw.

Although the town does not set a maximum slope for development per se, it does set a maximum slope of 12% for new subdivision roads, which helps to keep development out of particularly steep areas subject to erosion. Ayer has good zoning provisions for the regulation of land clearing and grading. The erosion control section of the bylaw addresses disturbances over 10,000 square feet or approximately  $\frac{1}{4}$  acre. The town sets maximum building coverage as a percentage of lot area, as well as requiring a minimum percentage of open space or vegetated area on a lot, both of which help minimize impervious surfaces.

Directly defining and limiting impervious surfaces in all zoning districts may be even more effective in safeguarding water quality impacts resulting from development and redevelopment. Ayer has both floodplain and aquifer protection overlay districts, both of which date back to 1999 and as such should be reviewed in light of the latest science and models for these districts.

The town is in the process of a comprehensive update of its Zoning Bylaw, with a Town Meeting vote anticipated in March of 2018. This new bylaw will provide the framework for greater protection of natural resources in the development review process. Ayer's subdivision and site plan regulations are also in need of updating. Revising those parts of these regulations that pertain to reducing impervious surfaces, limiting the cutting of vegetation, encouraging shared parking, and otherwise retaining green space in the development process will help to reduce stormwater runoff and its attendant impacts on water resources. Ayer's floodplain maps date to 1982 and are out of date. The Town should contact the Federal Emergency Management Agency (FEMA) and state agencies responsible for updating the flood insurance maps to determine when Ayer is scheduled for a map update.

The Ayer Conservation Commission attempted to pass a new local wetlands protection bylaw in 2017, but decided to withdraw it. Ayer is subject to the federal NPDES Phase II stormwater

permit, and has both a standard Stormwater Management Bylaw and a bylaw addressing illicit discharges. Low-impact development techniques are mentioned and encouraged in the bylaw, but are not required. Activities disturbing greater than 40,000 square feet (about one acre) or disturbing more than 1,000 square feet on slopes greater than 15% require a stormwater permit to be issued by the Department of Public Works. This latter requirement is a good measure to help prevent and address erosion on steep slopes.

### ***Opportunities for Potential Improvement***

The Ayer Conservation Commission should complete the process of revising the local Wetland Protection Bylaw and bringing it to Town Meeting for a vote in the near future. Additional public education and outreach may help to ensure a positive outcome to this effort.

The town should check on when the 1982 Flood Insurance Rate Maps (FIRM) are scheduled to be revised and then consider rewriting its existing floodplain overlay district provisions in light of the latest science and practices for floodplain protection.

Those sections of the subdivision and site plan regulations that pertain to reducing impervious surfaces, encouraging shared parking, and retaining green space in the development process should be added or enhanced.

## **Bolton, Massachusetts**

Bolton is a small town on the outskirts of the greater Boston area, just south of the town of Harvard and northeast of Worcester. Bolton is bisected by interstate Route 495, which benefits commuters but also has increased development pressure in towns along its route. Between 1984 and 2004, Bolton's population increased by 80%, making it one of the fastest growing towns in Massachusetts. As of 2010, Bolton's population stood at 4,897. Most of Bolton is zoned for low-density residential use, although there are a small central business district and other non-residential zones. The western one-third of Bolton is within the Nashua River watershed, while most of central and eastern Bolton is within the Concord River watershed.

### ***Plans, Policies and Local Planning Capacity***

**Summary of Master Planning.** The town of Bolton Master Plan dates back to 2006, which makes it just over 10 years old. Bolton may want to consider revising this Plan in the near future, as ideally Master Plans should be revisited every ten years or so in order to stay current

and reflect the latest available planning tools. Bolton's most recently approved Open Space and Recreation Plan (OSRP) dates to 2005, though the town has recently completed a new draft OSRP that has yet to be approved by the Massachusetts Division of Conservation Resources. Bolton is a designated Green Community (*see last footnote above.*)

**Local Planning Capacity.** Bolton has a full-time Planner as well as a Conservation Agent, which positions it well in terms of addressing the resource protection and planning efforts needed to safeguard the outstanding resource and recreational values of the Nashua River. Bolton is the only town in the eleven town area that is part of the Metropolitan Area Regional Planning Commission based in Boston. Bolton has not yet adopted the Community Preservation Act, which could provide needed funds to help protect open space and cultural and historic resources. The Capital Planning Committee oversees land acquisition in the town. Bolton has a Trails Committee as well as an all-volunteer Conservation (Land) Trust.

### ***Zoning and Regulations***

Bolton has a “Farmland and Open Space Planned Residential Development” bylaw, which is basically an OSRD-type bylaw that allows this type of development by Special Permit from the Planning Board. It requires that 33% of the total tract area be preserved as permanently protected open space, less than the 50% recommended by the Massachusetts Executive Office of Energy and Environmental Affairs for this type of bylaw.

Although the town does not set a maximum slope for development per se, it does set a maximum slope of 10% for minor subdivision roads and 5% for major roads, which helps to keep development out of particularly steep areas subject to erosion. Bolton’s subdivision regulations were last revised in 2015.

The town of Bolton has a Local Wetlands Protection Bylaw, which is administered by the Conservation Commission. This bylaw features a 75-foot upland jurisdictional area, within which land-disturbing activities must be approved by the Commission. The bylaw also contains a 25-foot no-build area from wetlands and river areas subject to the Massachusetts Wetlands Protection Act.

Bolton is not subject to the federal NPDES Phase II stormwater permit and currently has no local Stormwater Management Bylaw or Regulations. However, the use of Low-Impact Development stormwater techniques is strongly encouraged in Section 5230.3 of the

Subdivision Regulations. This section is quite comprehensive in addressing stormwater management in new subdivisions.

The Bolton Zoning Bylaw, in Section 250.23, features provisions that go into detail on environmental protection and design standards for business, commercial, and industrial development. Bolton has a Floodplain Overlay District, which was most recently revised in 2011. It also has a general town-wide performance-based bylaw for groundwater protection (Chapter 147 of the General Bylaws), which lists Best Management Practices to safeguard the town's groundwater resources. This bylaw is administered by the Board of Health.

### ***Opportunities for Potential Improvement***

Directly defining and limiting impervious surfaces in all of Bolton's zoning districts may be even more effective than the current regulations in safeguarding water quality impacts resulting from development and redevelopment.

## **Brookline, New Hampshire**

Brookline is a small town of approximately 5,260 people located to the west of Hollis, New Hampshire, and north of Townsend, Massachusetts. State Route 13 that extends south through Townsend to Fitchburg and State Route 130 that extends west from Hollis, New Hampshire are the main routes serving Brookline. The Nissitissit River flows from Lake Potanipo in central Brookline, through the town, to its confluence with the Nashua River in Pepperell, Massachusetts.

### ***Plans, Policies and Local Planning Capacity***

**Summary of Master Planning.** Brookline's most recent Master Plan update dates to 2012. This Master Plan contains very detailed chapters on the protection of natural and water resources. Unlike in Massachusetts, towns in New Hampshire are not required to have up-to-date Open Space and Recreation Plans in order to qualify for State conservation funds. Nonetheless, Conservation Commissions often adopt their own land acquisition and stewardship plans to guide them in their conservation efforts.

Brookline's Conservation Commission has been proactive in protecting valuable riparian and wildlife habitat in the town, which for many decades was one of the fastest growing in New

Hampshire. The Conservation Commission has a stated goal of conserving 25% of the land in town and has made substantial progress toward this goal over the past 20 years.

**Local Planning Capacity.** Brookline has both a full-time Town Planner and Conservation staff person, which positions the town well for planning and conservation efforts aimed at better protecting the outstanding resources associated with the Nissitissit River and other valuable riparian areas. The Town updates its Zoning Ordinance, Subdivision Regulations and Site Plan Regulations on a regular basis. The town belongs to the Nashua Regional Planning Commission, which serves the towns in south-central New Hampshire.

### ***Zoning and Regulations***

Brookline has an OSRD ordinance, termed “Open Space Development.” Under Open Space Development, proposed subdivisions must preserve at least 35% of their area as permanently protected open space. Unless it is not feasible due to topography and the character of the land, all subdivisions on tracts greater than 20 acres must be submitted to the Planning Board as Open Space Developments.

Brookline’s Local Wetlands Protection ordinance features a 50-foot regulatory buffer, within which there is twenty-five foot no-build zone. Unlike the Commonwealth of Massachusetts, the State of New Hampshire does not set a mandatory 100-foot wide regulatory buffer. While wetlands themselves are protected from development, it is up to New Hampshire towns to decide whether to have a local wetlands protection bylaw and how strict it will be. Local Conservation Commissions can also designate “Prime Wetlands,” which can be afforded greater local protections. Brookline has designated 11 such prime wetlands since 1992.

The Zoning Ordinance also features a very detailed Aquifer Protection section, which oversees development over the town’s widespread stratified drift aquifers. Several high-risk land uses such as new underground petroleum tanks are prohibited. The Aquifer Protection zone has limits on impervious surfaces.

The town has previously not been subject to the federal NPDES Phase II stormwater permit, although it has detailed Stormwater Management provisions in Section 6.4 of the Planning Board’s Site Plan Regulations. This section places strong emphasis on the use of “green” LID stormwater control techniques. LID is considered the default practice, unless applicants can demonstrate that it will not be effective in a particular case.

Brookline has a floodplain overlay district and the floodplain maps were updated in 2009.

### ***Opportunities for Potential Improvement***

The first recommendation is for Brookline to consider increasing the 50-foot wetland protection regulatory buffer to 100 feet, and if possible, increasing the no-build zone from 25 to 50 feet. Doing so would provide even greater protection to wetlands and riparian habitats associated with the Nissitissit River. The Planning Board may also want to consider increasing the amount of permanently protected open space in Open Space Developments from 35% to 45% or 50%, in line with best practices for this planning technique. Directly defining and limiting impervious surfaces in all zoning districts may be even more effective in safeguarding water quality impacts resulting from development and redevelopment.

## **Devens, Massachusetts**

The Massachusetts Legislature established the Devens Regional Enterprise Zone in 1993 to guide and foster the successful reuse of the former Fort Devens military installation in a sustainable manner, achieving a balance of economic, social and environmental needs while maintaining and enhancing the natural resource base. Devens is located 35 miles outside of Boston, with a population of 1,840 as of the 2010 US Census. A focus on job re-creation, to make up for the over 7,000 military jobs that were lost since the closure of the US Army Base, has resulted in approximately 5,000 jobs.

### ***Governance***

Chapter 498 of the Acts of 1993 established a legal framework for the governance and development of a Devens Regional Enterprise Zone to promote the expeditious and orderly clean-up, conversion, and redevelopment of Fort Devens for non-military uses. This includes but was not limited to housing, industrial, institutional, educational, governmental, recreational, conservation, and commercial or manufacturing uses. Objectives were to prevent further blight, economic dislocation, and additional unemployment, while helping to strengthen the local economy, the regional economy, and the economy of the Commonwealth.

Chapter 498 also established the Devens Enterprise Commission (DEC), the regulatory and permit granting authority for the redevelopment of Devens. The DEC acts as a local planning board, conservation commission, board of health, zoning board of appeals, historic district

commission and in certain instances, as a board of selectmen. The DEC carries out these duties in the context of a unique and innovative one-stop, expedited Unified Development Permit System, which greatly streamlines the local regulatory process. Under this system, complete permit reviews for development projects are to take place within 75 days.

MassDevelopment is the state economic development agency that manages real estate, assessment, taxation, utilities and public works in Devens. Together MassDevelopment and the DEC share the municipal government functions of a typical city or town.

### ***Plans, Policies and Local Planning Capacity***

Master Planning:

- Devens Reuse Plan (1994): [www.devensec.com/development/Devens\\_Reuse\\_plan.pdf](http://www.devensec.com/development/Devens_Reuse_plan.pdf) - Master Plan for the orderly and sustainable redevelopment of Devens Regional Enterprise Zone.
- Devens Open Space and Recreation Plan (2008-2013):  
[www.devensec.com/development/Devens\(OSRP\\_1-23-08.pdf](http://www.devensec.com/development/Devens(OSRP_1-23-08.pdf) - 1,800 acres of the 4,400 acres to be permanently protected as open space (natural resource protection, green infrastructure connections, recreation). To date, over 1,400 acres have been permanently protected, including over 900 acres along the Nashua River (US Fish and Wildlife Service and Massachusetts Fish and Wildlife Service). Devens Open Space and Recreation Advisory Committee is comprised of representatives from MassDevelopment, DEC, Ayer, Harvard, Shirley, US Fish and Wildlife Service (USFWS), Massachusetts FWS, NRWA and Massachusetts Executive Office of Energy and Environmental Affairs (EOEEA).
- Devens Water Resource Protection Report:  
[www.devensec.com/development/Water\\_Resources\\_Protection\\_Report.pdf](http://www.devensec.com/development/Water_Resources_Protection_Report.pdf) - Focus on specific strategies for development to ensure groundwater protection for a high quality and drinking water source.

**Local Planning Capacity.** Devens Enterprise Commission is a regional board appointed by the governor with representatives from Ayer, Devens, Harvard, Shirley, and the surrounding region. The DEC has a full-time Director of Planning and an Environmental Planner.

## **Zoning and Regulations**

**Devens Bylaws** (2015): [www.devensec.com/bylaws/bylawstoc.html](http://www.devensec.com/bylaws/bylawstoc.html) - Provide broad authority to help achieve reuse plan objectives, including 25% affordable and special-needs housing.

**Devens Rules and Regulations** (2013).: [www.devensec.com/rules-regulations/decregstown.html](http://www.devensec.com/rules-regulations/decregstown.html) - Detailed development regulations use innovative approaches for:

1. Stormwater management (LID and green infrastructure): [www.devensec.com/rules-regulations/decregs408.html](http://www.devensec.com/rules-regulations/decregs408.html)
2. Energy efficient, smart and sustainable residential development: [www.devensec.com/rules-regulations/decregs502.html](http://www.devensec.com/rules-regulations/decregs502.html)
3. Natural resource protection (Massachusetts Department of Environmental Protection SMS apply to all areas defined as resource areas – not just wetlands) [www.devensec.com/rules-regulations/decregs406.html](http://www.devensec.com/rules-regulations/decregs406.html)
4. Landscape preservation, viewshed preservation and construction management: [www.devensec.com/rules-regulations/decregs304.html](http://www.devensec.com/rules-regulations/decregs304.html)
5. Green building incentives.
6. Water resource protection districts: [www.devensec.com/rules-regulations/decregs409.html](http://www.devensec.com/rules-regulations/decregs409.html)
7. Water use and water efficiency regulations: [www.devensec.com/rules-regulations/decregs809.html](http://www.devensec.com/rules-regulations/decregs809.html)
8. Greenhouse Gas Mitigation regulations: [www.devensec.com/rules-regulations/decregs411.html](http://www.devensec.com/rules-regulations/decregs411.html)
9. Renewable Energy regulations: [www.devensec.com/rules-regulations/decregs411.html](http://www.devensec.com/rules-regulations/decregs411.html)
10. Steep slope regulations: [www.devensec.com/rules-regulations/decregs306.html](http://www.devensec.com/rules-regulations/decregs306.html)
11. Complete Street Standards (narrow road widths, connectivity, multi-modal, universal accessibility) [www.devensec.com/rules-regulations/decregs207.html](http://www.devensec.com/rules-regulations/decregs207.html)
12. Transportation demand management programs:  
[www.devensec.com/development/TMI\\_Overview.pdf](http://www.devensec.com/development/TMI_Overview.pdf)
13. Parking maximums as opposed to minimums (pavement reduction).

**Eco-Industrial Development (EID).** Devens is internationally recognized as an Eco-Industrial Park, a sustainable development approach to traditional industrial parks. The “eco” of eco-

industrial relates to its key concept, which is to learn from and model industrial development on natural systems ecology. Natural systems use resources so efficiently that there is no waste; all byproducts produced by nature are consumed or reused by other plants, animals or organisms. By applying this efficiency/no-waste model to industrial parks, EID can decrease or eliminate pollution and waste, while improving our economy and quality of life at the same time.

[www.devensec.com/sustain/EID\\_As\\_a\\_Sustainable\\_Development\\_Approach.pdf](http://www.devensec.com/sustain/EID_As_a_Sustainable_Development_Approach.pdf)

## Dunstable, Massachusetts

Dunstable is a small town on the Massachusetts/New Hampshire border, located north of Groton and east of Pepperell, Massachusetts. As of 2017, Dunstable's population stood at 3,199. Dunstable's current land use consists mainly of forest, agriculture and low-density residential use. The zoning is primarily residential, with a few very small areas devoted to commercial development.

### ***Plans, Policies and Local Planning Capacity***

**Summary of Master Planning.** The town of Dunstable's Planning Board is in the process of updating its 1999 Master Plan. The town's Master Plan Committee is overseeing the process. Much of the new Master Plan exists in draft form and is very comprehensive. The Master Plan Committee is aiming for approval of the Master Plan at the 2018 Annual Town Meeting. Dunstable's most recently approved Open Space and Recreation Plan (OSRP) dates up to 2017, though the town has begun the process of updating this Plan. Dunstable is not a designated "Green Community."

**Local Planning Capacity.** Dunstable does not have any professional planning and zoning or conservation staff beyond an Administrative Assistant and therefore relies on the work of citizen volunteers in addressing local permitting and planning. The town belongs to the Northern Middlesex Council of Governments (NMCOG), which functions as a regional planning commission. The town adopted the Community Preservation Act in 2006, which provides additional funding for land acquisition.

## ***Zoning and Regulations***

Dunstable has an OSRD bylaw, which allows this type of development by Special Permit from the Planning Board on tracts of at least 14 acres. It requires that 35% of the total tract area be preserved as permanently protected open space, less than the 50% recommended by the Massachusetts Executive Office of Energy and Environmental Affairs for this type of bylaw.

Dunstable has a Local Wetlands Protection Bylaw, administered by the Conservation Commission. The bylaw features a sixty-foot (60) wide setback from wetland resource areas for new permanent structures. This is a good measure, one that could be enhanced by an accompanying no-disturbance buffer of 40 feet or more.

Although Dunstable is not currently subject to the federal NPDES Phase II stormwater permit, it will be subject to the 2016 permit for the “Urbanized Areas” in town. Dunstable is preparing the Municipal Separate Stormwater Sewer Systems (MS4) permit application. Dunstable also has a local Stormwater Management Bylaw in its general bylaws. This bylaw has two tiers of permitting; one for relatively minor projects (“Tier 1”) disturbing from 22,000 to 40,000 square feet of area and one for major projects (“Tier 2”) disturbing more than 40,000 square feet of area. Any activity disturbing land on slopes greater than 15% that results in greater than 200 square feet of disturbance is also subject to a (major) stormwater permit. Dunstable also has a Water Supply Protection Bylaw, administered as an overlay district with permitting through the Planning Board.

The town has a floodplain overlay district in the Zoning Bylaws [15.2. Floodplain District [Amended ATM May 10, 2010] 15.2.1]. The Floodplain District is established as an overlay district effective in all districts. The uses permitted in the underlying district are allowed with the provision that they meet additional requirements. The Floodplain District includes all special flood hazard areas designated as Zone A or Zone AE on the town of Dunstable Floodplain District Overlay Map.

## ***Opportunities for Potential Improvement***

Dunstable should adopt its updated Master Plan as soon as possible, which will enable the town to better propose and adopt innovative land-use controls to protect its outstanding resources. The Planning Board may also wish to increase the amount of permanently protected open space in OSRD subdivisions from 35% to 50%, and perhaps require permanent protection

in environmentally sensitive zones that could be regulated as overlay districts (aquifer, riparian, etc.).

Dunstable's Local Wetlands Protection Bylaw has a 60-foot setback for new permanent structures, which could be enhanced by a somewhat less wide no-disturbance buffer, perhaps 40 feet or greater.

Directly defining and limiting impervious surfaces in all zoning districts may be even more effective in safeguarding water quality impacts resulting from development and redevelopment.

## Groton, Massachusetts

Groton is a mid-sized town near the Massachusetts/New Hampshire border, located north of Ayer and south of Dunstable, Massachusetts. As of 2012, Groton's population stood at 10,873. Groton's diverse mix of land uses includes substantial active agricultural lands, forests, and residential and commercial development in its downtown. Groton has a very comprehensive set of zoning bylaws and regulations, reflecting the importance the town places on planning and conservation.

### ***Plans, Policies and Local Planning Capacity***

**Summary of Master Planning.** The town of Groton completed its most recent Master Plan in 2011. This Master Plan is organized around the concept of sustainability, as reflected in the three-legged stool of sustainable environmental, economic, and societal factors. As described in the introduction, “*Sustainability* is the overarching focus of Groton’s Master Plan and a common thread in all of the plan’s elements. To facilitate a wide-ranging discussion of sustainability, the Groton Planning Board adopted the well-known Brundtland Commission’s definition of sustainable development, originally published in *Our Common Future* (1987): “*Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs.*”

Groton’s most recently approved Open Space and Recreation Plan (OSRP) dates to 2012. The 2011 Master Plan has a comprehensive chapter devoted to open space and recreation. Groton has protected about 7,790 acres of land, representing about 30% of its land area.

**Local Planning Capacity.** Groton has had a full-time Town Planner for several decades, as well as a full-time Conservation Agent/Administrator. The town belongs to the Montachusett Regional Planning Commission. The town adopted the Community Preservation Act in 2004 and has an active Community Preservation Committee to oversee and plan projects using CPA funds. Groton has always placed strong emphasis on municipal planning and as such has a very strong planning capacity to address the aims of Wild and Scenic River designation.

### ***Zoning and Regulations***

Groton has an OSRD bylaw, termed “Flexible Development,” which provides for this type of development through Special Permit from the Planning Board. The bylaw requires that 35% of the total tract area be preserved as permanently protected open space, less than the 50% recommended by the Massachusetts EOEEA for this type of bylaw.

Groton recently revised its Local Wetlands Protection Bylaw, which is administered by the Conservation Commission. This bylaw features a 50-foot combined no-disturbance/no-build buffer from all wetland resource areas. The bylaw also treats upland areas within the 100-foot regulatory buffer as resource areas, affording them and adjacent wetlands greater protection from the adverse impacts of land disturbance.

The town addresses erosion control measures in Section 352-19 of its Stormwater Regulations. Limits on impervious surfaces are specified in Section 218-20 of the Groton Zoning Bylaws. These limits range from a low of 25% for low-density residential uses to a high of 75% for industrial uses. Section 218-23 of the Zoning Bylaws contains provisions for shared parking for non-competing abutting uses, which can also reduce the creation of new impervious surfaces.

Groton also has thorough groundwater and aquifer protection measures in its zoning bylaws. The town is subject to the federal NPDES Phase II stormwater permit and does have a local Stormwater Management Bylaw, both for land disturbing activities and illicit discharges to the storm drain system and receiving waters. This bylaw has two tiers of permitting: one for relatively minor projects disturbing from 20,000 to 40,000 square feet of area and one for major projects disturbing more than 40,000 square feet of area. LID techniques must be incorporated into development and redevelopment projects unless it can be demonstrated that

the use of such techniques is not feasible in a given situation. LID must also be used for stormwater management in the Town Center Overly District centered on Station Avenue.

The Town does have a floodplain overlay district that the Building Inspector shall review for reasonable utilization toward meeting the elevation or floodproofing requirements and that no building or structure shall be erected in the one-hundred-year floodplain designated as Zones A and Zone A and AE on the Flood Insurance Rate Map.

### ***Opportunities for Potential Improvement***

Directly defining and limiting impervious surfaces in all zoning districts may be even more effective in safeguarding water quality impacts resulting from development and redevelopment.

## **Harvard, Massachusetts**

Harvard is a small to mid-sized town in north-central Massachusetts, with State Route 2 running through the town from east to west and Interstate Route 495 slicing its eastern border. As of 2017, Harvard's population stood at 6,021.

### ***Plans, Policies and Local Planning Capacity***

**Summary of Master Planning.** Harvard most recently updated and approved its Master Plan in 2016, making it one of the most recent Master Plans of the Nashua River Wild and Scenic River area towns. This Master Plan contains a very detailed water resources protection chapter. Harvard has a very comprehensive set of zoning bylaw and regulations, reflecting the importance the town places on planning and conservation. In 2016, Harvard also adopted a new Open Space & Recreation Plan. This Plan is very comprehensive and focuses in particular detail on protection of the Bare Hill Pond watershed.

**Local Planning Capacity.** Harvard has recently contracted for a part-time Town Planner after many years of having a part-time Planner/Conservation Agent. The town belongs to the Montachusett Regional Planning Commission. It was an early adopter of the Community Preservation Act in 2001. The Conservation Commission functions as a land acquisition and management body, in close cooperation with the non-profit Harvard Conservation Trust.

## ***Zoning and Regulations***

Harvard has an OSRD bylaw, termed “Open Space Conservation and Planned Residential Development” (OSP-PRD), which provides for this type of development through Special Permit from the Planning Board. It requires that 50% of the total tract area be preserved as permanently protected open space, one of the highest such requirements found in the Nashua River area towns. OSD-PRD can be undertaken on tracts as small as 4.5 acres, and the Planning Board does not establish a minimum building lot area per se, which is a very innovative approach.

Harvard’s Local Wetlands Protection Bylaw, which is administered by the Conservation Commission, is also one of the more stringent in the Nashua River watershed. This bylaw features a 50-foot no-disturbance zone as well as a 75-foot no-build zone. The bylaw also treats upland areas within the 100-foot regulatory buffer as resource areas, affording them and adjacent wetlands greater protection from the adverse impacts of land disturbance.

One of Harvard’s most unique zoning provisions is the **Nashua River Watershed Greenspace Buffer District**, which is a component of Harvard’s Watershed Protection and Flood Hazard overlay district. This buffer district extends along the Nashua River, from its highest point in Harvard northward to its lowest point in Harvard, and includes an area 300 feet from the centerline of the Nashua River. Detailed provisions for this overlay district are found in Section 125-25 c. of the Harvard Zoning Bylaws, which states that:

“No building for human occupancy and no sewage disposal system or other potential source of substantial contamination is permitted. However, if an applicant proves satisfactorily that his land is in fact not subject to inundation and not unsuitable for residential use because of drainage conditions and not an inland wetland under Chapter 131 G.L., the Planning Board may authorize by special permit (see § [125-46](#), Special permits) the use of such land as if in an AR District or, if such land does not abut an AR District but does abut a district other than a W District, as if in the other district.”

Harvard’s zoning does not explicitly describe limits on impervious surfaces per se, although it effectively limits such areas by requiring that the floor area of all new buildings not exceed 10% of the lot area (Sec.125-30a). The town is presently not subject to the federal NPDES Phase II stormwater permit. The town has a floodplain overlay district, which uses recently

undated Flood Insurance Rate Maps (FIRM) dating to 2011 and 2014 for delineation of floodplain and floodway boundaries. No new permanent structures are permitted in the floodplain overlay district. Harvard presently does not have an aquifer or groundwater protection overlay district.

### ***Opportunities for Potential Improvement***

In general, Harvard has an excellent set of bylaws, regulations, and an up-to-date Master Plan. Its wetlands protection bylaw features the most protective no-disturbance and no-build buffers in the Nashua River watershed region. Though the town is not subject to the federal NPDES Phase II stormwater general permit, adopting a stormwater control bylaw and regulations would offer even greater protection for Harvard's surface water resources. The town should consider adopting an aquifer and/or groundwater protection overlay districts. Directly defining and limiting impervious surfaces in all zoning districts may be even more effective in safeguarding water quality impacts resulting from development and redevelopment.

## **Hollis, New Hampshire**

Hollis is a small town of 7,817 people located west of Nashua, New Hampshire and to the east of Brookline, New Hampshire, with Pepperell, Massachusetts bordering on the south. The Nissitissit River flows through southwestern Hollis after entering the town from Brookline before flowing into the Nashua River in Pepperell. Southern and central Hollis contains extensive agricultural land encouraged by the presence of agricultural soils of extensive prime and statewide importance, while northern Hollis is more forested.

### ***Plans, Policies and Local Planning Capacity***

**Summary of Master Planning.** Hollis's most recent Master Plan update dates to 1998. Though not up to date, this Master Plan contains very detailed chapters on the protection of natural and water resources.

Unlike in Massachusetts, towns in New Hampshire are not required to have up-to-date Open Space and Recreation Plans to qualify for state conservation funds. Nonetheless, Conservation Commissions often adopt their own land acquisition and management plans to guide them in their conservation efforts. Hollis's Conservation Commission and Land Protection Study Committee have been proactive in protecting valuable riparian and wildlife habitat in the town.

Approximately one-third of Hollis's land area is protected open space, much of it held by the non-profit Beaver Brook Association.

**Local Planning Capacity.** Hollis has a part-time Town Planner as well as a Conservation Commission staff person, which enables the Town to better implement its plans and enforce the provisions of the zoning ordinance and related regulations. The town updates its Zoning Ordinance, Subdivision Regulations, and Site Plan Regulations on a regular basis. The town belongs to the Nashua Regional Planning Commission, which serves the towns in south-central New Hampshire.

### ***Zoning and Regulations***

Hollis has an OSRD ordinance, termed "Hollis Open Space Planned Development" (HOSPD). Under HOSPD, all proposed major subdivisions must preserve from 40-50% of their area as permanently protected open space, depending on the density of units proposed on the tract. Major subdivisions are those creating five or more new building lots.

Hollis's Local Wetlands Protection ordinance features a 100-foot regulatory buffer zone. While wetlands themselves are protected from development, it is up to New Hampshire towns to decide whether to have a local wetlands protection bylaw and how strict it will be. The wetlands ordinance prohibits new primary structures that are not "grandfathered" by virtue of being proposed on lots predating the wetland ordinance.

Local Conservation Commissions can also designate "Prime Wetlands"<sup>189</sup> through a state-approved process that affords these wetlands additional scrutiny in the permitting process. Although Hollis has not designated Prime Wetlands meeting the State definition, it has designated certain wetlands as sensitive environmental areas that should be given special consideration and protection during the permit application process.

The Zoning Ordinance also features a very detailed Aquifer Protection section, which oversees development over the town's widespread stratified drift aquifers. Several high-risk land uses such as new underground petroleum tanks are prohibited. Limits on impervious surfaces are

---

<sup>189</sup> From Hollis, New Hampshire wetland ordinance definitions: PRIME WETLAND: Under the New Hampshire statute (RSA 482-A) for protecting wetlands from "despoliation and unregulated alteration", municipalities are able to designate some of their high value wetlands as "Prime Wetlands" (RSA 482-A:15). These designated wetlands are given special consideration by the Wetlands Board in permit application reviews.

found in the Aquifer Protection zone. The town has previously not been subject to the federal NPDES Phase II stormwater permit, although it has had a Stormwater Management Committee. Hollis has a floodplain overlay district and the floodplain maps were updated in 2009.

## Lancaster, Massachusetts

Lancaster is a small to mid-size town in north central Massachusetts that is close to Routes 2, I-190, and I-495, and has been growing steadily for more than 10 years. Lancaster aims to shape and guide its growth so that the town retains its character and identity, while fostering the expansion of the tax base and citizen services. As of 2016, Lancaster's population stood at 8,186.

### ***Plans, Policies and Local Planning Capacity***

**Summary of Master Planning.** Lancaster completed its most recent Master Plan in 2007, its first new Master Plan in 40 years. Although 10 years old, this plan is extremely comprehensive and still suitable as the basis for current and future planning, zoning and regulatory efforts. The Master Plan does not have a dedicated Water Resources chapter, as these are discussed in the more comprehensive Open Space and Natural Resources chapter. The town will begin the process of updating the Plan in 2018, to reflect new planning practices and trends.

Lancaster's most recently approved Open Space and Recreation Plan (OSRP) dates to 2010. This Plan includes detailed chapters on water resource and wildlife habitat protection. Massachusetts recommends that OSRPs be revised every seven years in order to serve as the basis for state-funded grant applications. Lancaster's Open Space and Recreation Committee have been working on an update since January 2017 and expects to have a copy ready for re-certification by the end of 2017.

The 2014 Lancaster Green Belt Vision Plan was created to form a continuous, contiguous greenway of parcels that run from south Lancaster, along the Nashua River, to north Lancaster. The Green Belt will provide town-wide recreational trails, as well as a corridor for migratory wildlife.

**Local Planning Capacity.** Lancaster has a full-time Town Planner as well as a Conservation Agent. The Town land use boards and commissions (Planning Board, Conservation

Commission, and Zoning Board of Appeals) regularly update their respective bylaws and regulations. Lancaster is also a member of the Montachusett Regional Planning Commission (MRPC), which is chartered to carry out comprehensive regional planning. MRPC offers technical and professional services to its members, including planning in the areas of community development, economic development, transportation, housing, environment, and geographic information systems.

### ***Zoning and Regulations***

**Flexible Development Bylaw.** Lancaster's open space residential development bylaw provides for this type of development through a Special Permit from the Planning Board. This bylaw, called "Flexible Development," requires that 40% of the total tract area be preserved as permanently protected open space, in exchange for smaller lot sizes in a clustered arrangement.

**Wetlands Protection Bylaw.** Lancaster's local Wetlands Protection Bylaw was last revised in 2007. The bylaw features a 25-foot no-disturbance buffer from all wetland resource areas. Although this is certainly better than not having a no-disturbance buffer, the latest science on wetland buffer zones supports a wider no-disturbance buffer for adequate protection of water quality and habitat values of wetlands adjacent to development.

**Stormwater Management Bylaw.** The town is subject to the federal NPDES Phase II stormwater permit. As such, the town adopted a Stormwater Management Bylaw in 2007, an Illicit Discharge Bylaw in 2007, and a Water Withdrawal Bylaw in 2010. All of the bylaws serve the town well in the protection of its rivers and water bodies, as they are heavily enforced.

**Overlay Districts.** Lancaster has a Water Resource Protection Overlay District in the Zoning Bylaw. This bylaw primarily addresses the protection of groundwater, most specifically the stratified drift aquifers in town. Any use that would render any lot in the overlay district with 15% or greater impervious surfaces requires a special permit from the Planning Board. The Town also has a Floodplain Overlay District and Bylaw that was recently revised in 2011, coincident with the town's floodplain (FIRM) map revisions by FEMA.

## ***Other Initiatives***

**Green Community.** In 2010, Lancaster was designated as a Green Community by the Massachusetts Department of Energy Resources, one of the first municipalities in the state to receive that distinction. The designation mandates that the town's municipal facilities and vehicles must reduce energy consumption by 20%. The town has undertaken several actions to meet this goal, such as new heating systems, upgraded lighting, insulation and weatherization measures, LED street lighting, and electric vehicles with a docking station.

**Complete Streets.** In 2017, Lancaster was designated as a “Complete Streets” community by the Massachusetts Department of Transportation (DOT). The Complete Streets program provides funding to municipalities for construction of pedestrian- and bicycle-friendly roads, sidewalks, and connections to places of public interest. A prioritization plan was adopted, and in its first year the town will start sidewalk reconstruction on Main Street, along with curb ramps and cross walks. Bicycle racks will also be installed at the library, Community Center, and elementary and middle schools.

**Land and Water Conservation Fund Grant.** In 2016, a Land and Water Conservation Fund (LWCF) grant was received from the National Park Service and administered by the Massachusetts Department of Conservation Services, for the construction of a multi-purpose, multi-generational park space called the Nathaniel Thayer Memorial Park. Phase 1 of the park project, a playground with a splash pad and bathroom facility, will be constructed in 2018. Other pieces of the park will include athletic fields, passive recreation fields, a basketball court, tennis courts, dog park, walking paths, and an amphitheater.

**Bartlett Pond Dam Removal.** In 2014, the dam at the Bartlett Pond Recreation Area was removed. The dam removal has improved the water quality of the Wekepeke Brook, which was classified as a distressed waterbody. The removal of the dam and concrete impoundment has allowed for the replacement of warm still water with free-flowing, oxygenated, cooler, deeper water, which has had a large-scale benefit for local habitat.

**Designated Blue Trail.** In 2016, the Lancaster Friends of the Nashua River officially designated the Town's first “blue trail,” or water trail, on the North Nashua River. The blue trail runs from a launch point at I-190 to a take-out point some miles downstream at the

Pellechia Recreation Area, south of the Cook Conservation Area along the North Nashua River. Signs along the roadside and riverside direct the public to these locations.

### ***Opportunities for Potential Improvement***

The first recommendation is that Lancaster should consider updating its 2007 Master Plan. Although the existing Master Plan reflects the first major revision in decades, several sections would likely benefit from updating. The town should continue its efforts to update the 2010 Open Space and Recreation Plan, which is due to be completed by the end of 2017. The town should also continue its efforts to plan for the Green Belt as outlined in the 2014 Green Belt Vision Plan.

The Conservation Commission may also want to consider increasing the no-disturbance buffer in its local Wetlands Protection Bylaw to greater than 25 feet. The science supports having much more extensive no-disturbance buffers, especially for the protection of riparian habitats and their associated assemblage of species. Finally, directly defining and limiting impervious surfaces in all zoning districts may be even more effective in safeguarding water quality impacts resulting from development and redevelopment.

## **Pepperell, Massachusetts**

Pepperell is a mid-sized town on the Massachusetts/New Hampshire border, located north of Groton and south of Brookline and Hollis, New Hampshire. As of 2016, Pepperell's population stood at 12,152. Like other older mill towns once dependent on waterpower for industry, Pepperell has several villages within its borders, including East Pepperell near the Pepperell Dam on the Nashua River, Pepperell Center, and Pepperell's Historic District to the west of the center. Over the decades, the Pepperell Conservation Commission and other land protection entities such as MassWildlife, Nashoba Conservation Trust, and Nissitissit River Land Trust have protected several thousand acres of land, much of it centered on Gulf Brook, a trout stream that flows into the Nissitissit River. This conservation land forms a linear network of protected land, which can serve as a good model for effective protection of wildlife habitat.

### ***Plans, Policies and Local Planning Capacity***

**Summary of Master Planning.** Pepperell—designated a Green Community in 2015—completed its most recent Master Plan in 2007. This plan, although now 10 years old, is very

comprehensive and still suitable as the basis for future planning and zoning and regulatory efforts. This Master Plan does not have a Water Resources chapter per se, though water resources are described in the Natural Resources chapter. The Northern Middlesex Council of Governments (NMCOG) has been contracted to update Pepperell's Master Plan. A Master Plan Committee has been organized as of 2018 and a new Master Plan should be ready for adoption by Town Meeting in the near future.

Pepperell recently updated its Open Space and Recreation Plan (OSRP) in 2016, which has been approved by the State. OSRPs are considered current for seven years. This Plan includes detailed chapters on water resource and wildlife habitat protection.

**Local Planning Capacity.** Pepperell has a full-time Town Planner as well as a part-time Conservation Administrator. The Town Land Use Boards (Planning, Conservation Commission, and Zoning Board) regularly update their respective bylaws and regulations. Unlike most of the other towns in the Nashua River Wild and Scenic area that belong to the MRPC, Pepperell, along with Dunstable, are members of the NMCOG, a regional planning agency.

### ***Zoning and Regulations***

Pepperell's OSRD bylaw provides for this type of development through Special Permit from the Planning Board. It requires that 40% of the total tract area be preserved as permanently protected open space, slightly less than the 50% recommended by the Massachusetts Executive Office of Energy and Environmental Affairs for this type of bylaw.

Pepperell's Local Wetlands Protection Bylaw, last revised in 2002, features a combined 50-foot no-disturbance/no-build buffer from all wetland resource areas. This is one of the wider such no-disturbance buffers within the Nashua River watershed region.

Pepperell also has a thorough groundwater and aquifer protection bylaw, termed the Water Resource Protection Overlay District (WRPOD). The WRPOD covers much of the western part of the town and an area around the Jersey Street wells and the Nashua Road well, which is on the Hollis, New Hampshire state line.

Section 5530 of Pepperell's Zoning Bylaw has a good section on erosion control. The town is subject to the revised federal NPDES Phase II stormwater permit, which it will need to address

in 2018, if the current federal schedule holds. The town was able to obtain an exemption from the previous version of the permit issued in 2004. Pepperell will need to adopt a local Stormwater Management Bylaw and undertake the other minimum controls specified in the stormwater permit. The town will need to comply with the new stormwater permit, which is currently under appeal. Pepperell has contracted with a consulting firm to assist in preparing its Notice of Intent (NOI).

The town is a member of the Northern Middlesex Stormwater Collaborative and participates in meetings and training sessions related to stormwater regularly. Pepperell is planning to adopt a Stormwater Bylaw and exploring ways to fund efforts (perhaps a stormwater utility) to comply with the permit. All zoning regulations will be reviewed to determine which regulations will require updating, changes, etc. for compliance with the Permit or to address minimizing impervious surface impacts.

The town floodplain overlay district, included in the Code of the town of Pepperell, was adopted on June 7, 1993 and amended on May 3, 2010. This floodplain bylaw only addresses construction in the floodway, however, and not within the wider 100 and 500-year floodplain zones.

### ***Opportunities for Potential Improvement***

Pepperell might consider revising its floodplain protection bylaw and/or regulations to address all impacts within the 100 and 500-year floodplains, not just within the floodway itself.

Directly defining and limiting impervious surfaces in all zoning districts may be even more effective in safeguarding water quality impacts resulting from development and redevelopment. This will be addressed as part of the review process under stormwater.

## **Shirley, Massachusetts**

Shirley is a small to mid-sized town of approximately 5,700 town residents and 1,000 prison inmates located to the west of Ayer and Harvard and adjacent to Devens in north-central Massachusetts.

### ***Plans, Policies and Local Planning Capacity***

**Summary of Master Planning.** The Shirley Planning Board adopted a revised Master Plan in late 2017. The town's Open Space and Recreation Plan (OSRP) has also recently been

updated; it was approved by EOEEA and accepted by the Shirley Town Meeting voters in late 2017. The OSRP includes detailed chapters on water resources and wildlife habitat protection as well as broad recommendations in regard to recreation. Shirley is a designated “Green Community.”

**Local Planning Capacity.** Shirley currently lacks a Town Planner. A part-time or full-time Planner would be very useful in ensuring the successful implementation of recommendations made in the revised Master Plan. The town is part of the Montachusett Regional Planning Commission. Shirley has not adopted the Community Preservation Act.

### ***Zoning and Regulations***

Shirley has an OSRD bylaw, termed “Low-Impact Development,” not to be confused with stormwater-related low-impact development. It requires that 35% of the total tract area be preserved as permanently protected open space, less than the 50% recommended by the Massachusetts Executive Office of Energy and Environmental Affairs for this type of bylaw. LID is allowed through Special Permit from the Planning Board. Amendments to the bylaw are recommended in the new Open Space and Recreation Plan.

Shirley’s Local Wetlands Protection Bylaw was originally adopted in 2005 and has not been revised since then. This bylaw features a 25-foot no-disturbance and a 40-foot no-build buffer from all wetland resource areas. Lots in existence when the bylaw was adopted are exempt from its provisions. Shirley also has a Water Supply and Wellhead Protection Overlay District for the protection of its groundwater resources.

The Town is subject to the federal NPDES Phase II stormwater permit and does have a local Stormwater Management Bylaw, both for land-disturbing activities and illicit discharges to the storm drain system and receiving waters. Activities disturbing one or more acres of land are required to obtain a stormwater management permit. Shirley has a floodplain overlay district and the floodplain maps were updated in 2010.

### ***Opportunities for Potential Improvement***

There are many opportunities to meet goals of this Stewardship Plan through implementing recommendations found in Shirley’s new Master Plan and Open Space and Recreation Plan.

One of these recommendations includes considering revisions to the town's Low Impact Development (OSRD) bylaw to protect more open space, and perhaps to rename the bylaw to alleviate confusion with the stormwater management use of the term. Revisions to the Shirley Non-zoning Wetlands Bylaw are also recommended. A no disturbance zone wider than 25 feet in the Local Wetlands Protection Bylaw would provide better protection to Shirley's wetlands and surface waters. Directly defining and limiting impervious surfaces in all zoning districts may be even more effective in safeguarding water quality impacts resulting from development and redevelopment. Review of all of the town's land-use and resource-protection bylaws and regulations in the next few years is anticipated. Opportunities for increasing public and town officials' awareness about natural resources, especially the protection of water quality, have also been identified, as have measures to increase public access to and recreational use of conservation lands and waterways. Alternative economic uses for undeveloped forest land, such as outdoor recreation and forest management, and options for land protection by entities other than the town, are also being discussed.

## **Townsend, Massachusetts**

Townsend is a mid-sized town on the Massachusetts/New Hampshire border, located north of Lunenburg and south of Brookline and Mason, New Hampshire. As of 2010, Townsend's population stood at 8,926. Townsend features several villages within its borders, such as the Harbor Pond area on an impoundment of the Squannacook River, West Townsend near the Ashby border, and Townsend Center with its classic town common at the intersection of Routes 13 and 119. Much of Townsend's land area is protected land within the Townsend and Willard Brook State Forests, which are administered by Massachusetts Department of Conservation and Recreation.

### ***Plans, Policies and Local Planning Capacity***

**Summary of Master Planning.** Townsend completed its most recent Master Plan in 2001. An attempt to update the Master Plan in 2008 was not brought to completion. The 2001 Master Plan should be revised as soon as practicable. Townsend's most recently approved Open Space and Recreation Plan (OSRP) dates to 2013. This Plan includes detailed chapters on water resource and wildlife habitat protection. Townsend is a designated Green Community.

**Local Planning Capacity.** Townsend has a full-time Planning Administrator as well as a Conservation Agent. Much of the Planning Administrator's function is related to plan review and the clerical functions of the Planning Board rather than Master Planning and other long-range projects. The town is part of the Montachusett Regional Planning Commission. The town attempted, but failed, to adopt the Community Preservation Act in the mid-2000s.

### ***Zoning and Regulations***

Townsend has an OSRD Bylaw, termed "Open Space Preservation Development," which provides for this type of development through Special Permit from the Planning Board. It requires that 30% of the total tract area be preserved as permanently protected open space, less than the 50% recommended by Massachusetts Executive Office of Energy and Environmental Affairs for this type of bylaw. The bylaw also requires applicants to demonstrate that an Open Space Planned Development (OSPD) is at least as good as or superior to a conventional development, which is a burden of proof that could discourage this type of development. The bylaw dates to 1986, with some revisions since then, and should be revisited in light of current recommended planning practices.

Townsend's Local Wetlands Protection Bylaw was originally adopted in 1983 and has been revised periodically since then. This bylaw features a 35-foot no-disturbance buffer from all wetland resource areas. This no-disturbance buffer is a good provision, although the latest wetland science supports a wider buffer to protect water quality and riparian wildlife habitat. Townsend has thorough groundwater and aquifer protection measures in its zoning bylaws.

The town is subject to the federal NPDES Phase II stormwater permit and does have a local Stormwater Management Bylaw, both for land disturbing activities and illicit discharges to the storm drain system and receiving waters. Activities disturbing 40,000 square feet or more of land, or 1,000 square feet or more on slopes greater than 15%, require a stormwater management permit. LID techniques are recommended but not absolutely required in the Stormwater Management Bylaw.

The town does have a floodplain overlay district, although the Building Inspector must check on whether construction is proposed in a floodplain and whether flood insurance is required. Townsend does have a floodplain overlay district and the floodplain maps were updated in 2010.

## ***Opportunities for Potential Improvement***

The first recommendation is to update the Master Plan, which dates to 2001 and is perhaps no longer an effective basis for zoning and other regulatory amendments that could help to safeguard the outstanding resource values identified in this report. Secondly, Townsend's Open Space Planned Development Bylaw should be revised to reflect the latest planning practices such as protecting a greater amount of open space and providing for more flexible dimensional requirements. Directly defining and limiting impervious surfaces in all zoning districts may be even more effective in safeguarding water quality impacts resulting from development and redevelopment.

## **REGULATORY SUMMARY TABLES**

This review provides tables for New Hampshire and Massachusetts that summarize the planning and regulatory matters for each town participating in the Stewardship Plan.

### **New Hampshire Regulatory Summary**

Category	Brookline	Hollis
Regulatory Measure	Valerie Rearick, Town Planner 1-603-673-8855 x 215	Wendy Trimble, PB Secretary 603-465-2209 x 108
<b>Master Planning</b>		
Current Master Plan?	<b>YES</b> – 2011 / 2012	<b>NO</b> – dates to 1998
Water Resources Protection Chapter?	YES	YES
Current Open Space Plan?		
Has the Zoning Bylaw been revised in the last five years?	YES	YES
<b>Land-Use Controls</b>		
Does the town have OSRD zoning?	YES	YES
If so, what is protected open space requirement?	35%	<b>40%-50%</b> depending on overall density of housing.
Is OSRD allowed by right or Special Permit?	Appears to be by right – follow subdivision Process	Special Exception (SP)
Does the town have a maximum slope for development?	Not per se – limits on new road and driveway slopes	Not per se–limits on new road and driveway slopes

Category	Brookline	Hollis
Does the town have <b>Erosion Control measures</b> for construction on steep slopes?	Has a Stormwater Management section 6.4 in Site Plan Regs. LID is default method. Very good.	Good standards for construction on steep slopes and hillsides in " <u>Rural Character Preservation Ord.</u> " <b>(OTHER – check)</b>
Does the zoning limit the % or area of impervious surfaces?	There are impervious limits found in the Aquifer Protection District.	Max. Building coverage in Comm. Zone / <b>More?</b>
Do <b>parking requirements</b> for commercial devt. provide for shared or alternative parking?	<b>YES</b> – good provisions for such in Site Plan Regs sec. 4.6.01	<b>YES</b> – shared parking is encouraged when possible.
Any resource protection overlay zones (beside wetlands)?	Yes, Aquifer Protection and Floodplain	
<b>Water Resource Zoning and Regulations</b>		
Does the town have a local Wetlands Protection Bylaw?	YES	YES
If so, are there no-disturbance or no-build setbacks?	There is a 50 foot no-build area within the 100 foot buffer zone	Not per se—but the bylaw is otherwise comprehensive.
If yes to a WPB, are upland areas adjacent to wetlands considered resource areas?	NO – may not be applicable in NH law?	NO - may not be applicable in NH law?
Does the town have an Aquifer or general groundwater protection bylaw?	YES	YES
Does the town have <b>wellhead protection</b> as part of this?	YES	YES
Does the town have a Stormwater Control Bylaw with LID provisions?	<b>YES</b> – Section 6.4 of Site Plan Regulations. Pretty good example.	There was a stormwater committee that has since disbanded. <b>Follow-up.</b>
What <b>area of land disturbance</b> triggers Stormwater Review?	I believe one-acre but I need to confirm.	Same as for Brookline.
Is <b>minimizing impervious surfaces</b> a goal of the stormwater bylaw or regs?	<b>YES</b> – right up front	
Is the use of LID <b>required</b> in certain circumstances?	<b>YES</b> – it is the default method	
<b>Protection of key wildlife habitat and natural communities?</b>		
Is protection of wildlife habitat and natural communities specified in OSRD or other zoning?	YES	YES
Is such addressed in Open Space or Master Plans?	YES	YES

Category	Brookline	Hollis
If so, what <b>areas</b> are called out in such plans?	See Natural Resource Chapter	Good provision for "Wildlife Habitat Inventory and Assessment" in Site Plan Regulations (page 4)
<b>Planning Capacity</b>		
NH programs?		
Does the Town have a full or part-time <b>Town Planner</b> or <b>Planning Administrator</b> ?	YES	<b>YES</b> - Full-time Planning Secretary and part-time Planner
Does the Town have a full or part-time <b>Conservation Administrator</b> ?	<b>YES</b> – Kristin Austin 603-673-8855 x 216	<b>YES</b> - Connie Cain 603-465-2209 x 105
Does the Town have a land acquisition Committee and/or fund for open space?	<b>YES</b> to both: 100% of Land-Use change tax goes to fund	<b>YES</b> to both: 50% of Land-Use change tax goes to fund
Which RPC does the Town belong to?	NRPC	NRPC
Something about success of Planning and Conservation warrant articles or bylaws at Town Meeting etc.?		
OTHER		Hollis has a " <b>Rural Character Preservation Ordinance</b> " that is quite innovative.

## Massachusetts Regulatory Summary

---

## (DRAFT) ZONING AND REGULATORY REVIEW: NASHUA WILD &amp; SCENIC RIVERS STUDY – Version 7

Category	Ayer	Bolton	Devens	Dunstable	Groton
Regulatory Measure	Heather Hampson is Planning Admin. @ 978-772-8218 Mark Archambault, Town Planner: 978-772-8218	Erica Uriarte, Town Planner @ 978-779-3308	Peter Lowitt, Director Neil Angus, Planner Devens Enterprise Commission	Cheryl Mann, Secretary 978-649-4514 x 230	Takashi Tada, Town Planner: 978-448-1105
Master Planning					
Current Master Plan?	YES – it is in the process of being updated as of 2017. Set for adoption in 2018.	YES – revised in 2006.		YES- in the process of being updated. Expected to be approved a fall STM 2017. The previous Master Plan dates to 1999.	YES – revised in 2011.
Water Resources Protection Chapter?	YES	NO – though water resource protection is mentioned.	YES – in OSRP. Also earlier VHB report from 1994.	NO – but water resources covered in Natural Resources.	YES
Current Open Space and Recreation Plan	NO – though it is slated for adoption in 2018.	YES	YES – covers the period 2008 – 2013, though data is still current (confirm with AI)	YES – covers the period 2010 – 2017. Will be updated this year.	YES – revised in 2012.
Designated “Green Community”?	YES	YES	N/A	NO	NO
Has the Zoning Bylaw been revised recently?	YES – it is in the process of being comprehensively updated as of 2017 and is scheduled for a Town Meeting vote in 2018.	YES	YES	YES – as recently as 2016.	YES

Land-Use Controls					
Does the town have OSRD zoning?	YES	YES - called "Farmland and Open Space Planned Res. Devt."	YES – called 'Innovative Residential Development'	YES – section 6.6 Min of 14 acres.	YES – called "Flexible Development"
If so, what is protected open space requirement?	50%	33% ( <i>Master Plan recommends increasing to 50%</i> )	Not fixed	35%	35%
Is OSRD allowed by right or Special Permit?	Special Permit. (OSRD is optional)	Special Permit	'Unified Permit' – OSRD is optional but incentivized though this process	Yes, by Special Permit. (OSRD is optional)	Special Permit.
Does the town have a maximum slope for development?	NO	Maximum slope of 10% for the smallest subdiv. lanes, other max. slopes specified in Sec. 5220.4 Subdiv. Regs.	<a href="#">See Stormwater Rules</a>	Yes under Stormwater and Erosion Control Bylaw (in General bylaw) ≥15% slope and >200 s.f disturbance in slope	Maximum slope of 10% for subdivision roads and driveways
Does the town have Erosion Control measures for construction on steep slopes?	YES. Ayer has good zoning provisions for regulation of land clearing and grading. Covers disturbances over 10,000 sq.ft.	NO – Not per se.	<a href="#">See Stormwater Rules</a>	Regulations for Stormwater and erosion control bylaw are currently be drafted.	YES – Section 352-19 in Stormwater Regulations
Does the zoning limit the % or area of impervious surfaces?	Percentage of 'open space' (non-impervious) required on a lot specified in Dim. Table. Also max. building coverage.	YES – there is a maximum 50% impervious in Comm. zone	YES – varied provisions in the Density / Intensity Regulations	There is a 25% lot coverage reqt. For buildings. (Sec. 11.4)	YES – described in the Schedule of Intensity Regulations: Sec. 218-20.

Do parking requirements for commercial devt. provide for shared or alternative parking?	YES, by Special Permit. See Sec. 9.1.5 (D) in zoning bylaw.	NO	YES – parking regulations emphasize shared parking as well as alternative pavement	No commercial development in town	YES – good guidelines for shared parking in Section 218-23.
Any resource protection overlay zones (besides wetlands)?	Floodplain and Aquifer Protection Overlay Districts	Floodplain and Mixed-Use Village Overlay Districts	Floodplain and Water Resources Protection.	Section 15.2.1 of Zoning bylaw- Floodplain District Overlay	Floodplain and Water Resources Protection.
DATE of FIRM maps flood zoning is based on	1982	2011	2011	2010	2010
<b>Water Resource Zoning and Regulations</b>					
Does the town have a local Wetlands Protection Bylaw to supplement the WPA?	NO	YES	YES	YES – the wetland protection bylaw was revised in 2013.	YES
If so, are there no-disturbance or no-build setbacks?	The Bylaw proposes a 100 foot <i>regulatory</i> buffer.	100 foot regulatory buffer with a 25 foot wide no disturbance zone from the edge of WPA juris. wetlands.	100 foot regulatory buffer with a 50 foot no-build zone and a 25 foot no-disturbance zone.	100 feet <i>regulatory</i> buffer zone. 60' No new permanent structure setback.	YES, there is a 50 foot combined no-disturbance / no-build zone.
If yes to a WPB, are upland areas adjacent to wetlands considered resource areas?	YES – within the 100 foot buffer zone.	YES – land within 75 feet of a wetland is considered a resource areas subject to review and permitting.	NO	NO	YES
Does the town have an Aquifer or general groundwater protection bylaw?	YES – Section 8.1	YES – there is a general town-wide bylaw for groundwater protection. General good practices listed.	YES	YES - Water Supply Protection Bylaw. Aquifer protected under this.	YES

Does the town have wellhead protection as part of this?	YES	YES	YES	YES - Zone 1 and 2 wellhead delineation protection	YES
Does the town have a Stormwater Control Bylaw with LID provisions?	SORT OF – has stormwater control bylaw, but LID not emphasized.	NO – though Sec. 5230.3 of the Subdiv. Regs. Has good provisions for such.	YES – 2012 – excellent Stormwater Management Section in 974 CMR 4.00, sec. 4.08	Has Stormwater and Erosion control bylaw but does not include LID.	YES
What area of land disturbance triggers Stormwater Review?	Typically 40,000 sq.ft. except for slopes > 15% then 1,000 sq.ft.	N/A	All development is subject to stormwater review	>20,000 s.f. requires Land disturbance permit from PB	>20,000 s.f. requires minor permit / > 40,000 s.f. major permit
Is minimizing impervious surfaces a goal of the stormwater bylaw or regulations?	NO	N/A	YES	In Water Supply Protection Bylaw 15% or 2500 s.f. (whichever greater) imperv. requires authorization if the water supply area.	YES
Is the use of LID required in certain circumstances?	NO	LID is required in the Commercial Zone and is strongly encouraged in Section 5230.3 of the Subdiv. Regs.	YES – emphasis on bioretention and biofiltration. LID is considered the default stormwater management technique in Sec. 4.08 2 ix.	NO	YES - Low-impact development (LID)/green infrastructure techniques must be incorporated into development and redevelopment projects in the Town unless it can be shown per § 352-9A(1) that the use of LID techniques is not feasible

Protection of key wildlife habitat and natural communities?	AYER	BOLTON	DEVENS	DUNSTABLE	GROTON
Is protection of wildlife habitat and natural communities specified in OSRD or other zoning?	YES – in the Erosion Control section	NO	YES, in Site Plan design standards there are requirements to preserve trees and reduce edge habitat on new development sites.	Yes, purpose in OSRD to preserve natural features and conditions. Not specific for wildlife habitat though.	YES
Is such addressed in Open Space or Master Plans?	YES	YES – Open Space and Recreation Plan is currently being revised. Town has excellent planning process.	YES – esp. the Open Space and Recreation Plan	Preserving open space, protecting natural communities and resource conservation are primary objectives in both Open Space and Master plans.	
If so, does it describe areas recommended for further protection in detail?	YES	The OSRP goes into great detail on recommended land for protection.	See Devens Open Space and Recreation Plan	YES - endangered wildlife habitat, groundwater and aquifers, fields and forests, river greenways, shorelines, Scenic roads and views, etc.	

Planning Capacity	AYER	BOLTON	DEVENS	DUNSTABLE	GROTON
Has the Town adopted the Community Preservation Act (CPA)?	YES – adopted in 2002.	NO	N/A	YES	YES – adopted in 2004.
Does the Town have a full or part-time Town Planner or Planning Administrator?	YES	YES	YES	NO	YES
Does the Town have a full or part-time Conservation Agent?	YES	YES – Rebecca Longvall 978-779-3304	YES	NO	YES
Does the Town have a land acquisition committee and/or fund for open space?	There's a Community Protection Advisory Committee (CPAC)	Capital Planning Committee oversees land acquisition			
Which Regional Planning Commission is the town part of? Does it actively engage with the RPC?	Montachusett Regional Planning Commission (MRPC)	Metropolitan Area Regional Planning Commission (MAPC)	Not Applicable to Devens	Northern Middlesex Council of Govts.	MRPC

## APPENDIX C: History of Water Quality in the Nashua River and Tributaries

by Warren Kimball

### Water Quality Standards

This Appendix describes the development of water quality standards in Massachusetts and summarizes several decades of classification data on water quality for representative segments of the Nashua River and its tributaries. Water Quality Standards were first established for the Commonwealth of Massachusetts by the Division of Water Pollution Control (DWPC) in 1967. They created four inland water classifications as water quality goals:

- Class A waters were designated as sources of public water supply.
- Class B waters were designated for aquatic life, recreation (swimming and boating) and aesthetics.
- Class C waters were designated for indigenous aquatic life, limited recreation (boating) and aesthetics.
- Class D waters were designated for aesthetic enjoyment only.

Table 1 shows the original Classifications assigned to certain segments of the Nashua River Watershed in 1967. It also shows the current condition of these waters in the early 1970s as listed in the first DWPC Nashua River Basin Management Plan (1975). A “U” designation signified “unacceptable,” meaning the current condition did not meet any of the existing Classifications. Waters in the Nashua River Watershed not listed here were Classified either A or B and were generally thought to meet those Classifications.

It can be seen that the condition of the main body of the Nashua River was grossly polluted at the time. Furthermore, the expectation for the river’s future was below Class B. Class B coincided with the national “fishable/swimmable” goal established in the Federal Clean Water Act of 1972.

During the public hearing process for the 1967 Massachusetts Water Quality Standards, Marion Stoddart testified on behalf of the Nashua River Clean-Up Committee. She presented a comprehensive package prepared by the Committee that showed overwhelming evidence for Nashua Wild and Scenic River Study Committee Draft Stewardship Plan

support of a B classification for the river. She also called for the elimination of Class D from the Standards.

When the Water Quality Standards were revised in 1974, Class D was eliminated. Also, Class C segments on the mainstem of the Nashua River, the South Branch, and the lower Squannacook River were reclassified to a new Class B1 designation. Class B1 had all the same criteria as Class B except for dissolved oxygen, which was held at a Class C level. The North Branch of the River remained at Class C.

The Standards were revised again in 1978. In this revision, all Class C and B1 segments of the river were upgraded to Class B. This was to reflect the desire to attain the national “fishable/swimmable” goal and did not indicate the current condition of the river.

The Squannacook and Nissitissit Rivers are both designated Class B, coldwater fisheries. This affords these rivers more stringent dissolved oxygen and temperature criteria within the B Classification. Other waters in this discussion are designated warmwater fisheries and have less stringent criteria than coldwater fisheries. Class C waters are not assigned a “fisheries” designation and have less stringent dissolved oxygen and temperature criteria than and warmwater fisheries.

## **Water Quality Report Cards**

In order to show the history of water quality of the Nashua River Watershed, the DWPC created water quality report cards to graphically display the water quality of the river at a point in time. Four report cards were created in order to show the existing water quality during each decade from the early 1970s to the early 2000s. They display the results of water quality surveys conducted primarily by the DWPC (and its successor agencies) during this time.

Reports selected for this Appendix single out the information on historically polluted portions of the river including the South Branch, North Branch, and mainstem of the Nashua River as well as two relatively clean tributaries, the Squannacook and Nissitissit Rivers. These rivers were divided into nine segments for the sake of discussion. Information on fish tissue was available only in the more recent assessments, and was spotty. Therefore, for the sake of trend analysis it is shown as “not assessed” on all the report cards in order to make the assessment more comparable.

For each of the nine segments, eight categories of pollutants are assessed for the aquatic life use and three categories of pollutants for the recreational uses. The level of pollution is color coded to verbal categories of “good,” “fair,” “poor,” and “very poor.” “Good” means meeting Class B criteria and the other categories roughly coincide with Class C, Class D, and U respectively. In order to provide a uniform basis of comparison, all water quality was assessed using criteria for a modern Class B water, meaning the criteria that would be used today.

Severity points were also assigned to these categories (1, 2, and 3 respectively) indicating the level of impacts depending on the degree to which Class B criteria are violated. Severity points in a segment can be totaled to compare with other segments or to the same segment over time. Total severity points can be further weighted by multiplying by the segment’s length. In this manner, the number of parameters violated, the severity of the violation, and the river miles affected can be tallied to glean additional useful information.

Caution should be used in viewing the report cards so that they are not afforded a degree of precision that is unwarranted. Water quality is highly variable and the data sets used to fill out the report card were seldom uniformly comparable. In a few instances, the information was contradictory. Additionally, the criteria used to assess the segments have changed over time as well as the Classifications of the waters. Considerable judgement was used in formulating the report cards. The use of broad verbal categories such as “good,” “fair,” and “poor” water quality and “slight,” “moderate,” and “severe” impacts is intentional and meant to envelop all the above considerations and sources for error. These same terms were often used in the source material to describe the river, the levels of pollution and the judgements used in the report cards.

The report cards are aimed at showing the relative change in water quality over time. For this purpose they are quite demonstrative.

## **Early Water Quality History**

The Nashua River watershed was once settled by the Nashaway native members of the Algonquin Tribe. One commonly accepted translation for their name for the river is “the river with the beautiful pebbled bottom.” They harvested plentiful salmon and alewives from the river. The area was subsequently settled and cleared by Massachusetts Bay colonists for farming and raising livestock.

During the 19<sup>th</sup> century, the watershed experienced extensive industrial development including gristmills, textile mills and paper manufacturing mills. It seems water quality at this time met the fishable/swimmable goal, according to a nineteenth century account from the history of the Town of Lancaster: “Some value the river for its enriching qualities, and some for its abundant water power, and some because they can idle away their time catching pout and pickerel. There are some also who delight in it as ‘a thing of beauty’ and a ‘joy forever.’ They love to wander on its banks, to plunge into its depths and float upon its surface. They return again and again to gaze on its flow when its shimmers in the sun, or is mottled by the raindrops, or ruffled by the breeze”.<sup>190</sup>

Unfortunately, the increased industrial development profoundly impacted the river. Paper manufacturing became the leading industry in the basin and numerous dams were built along the river and its tributaries to create storage impoundments for industrial process and cooling water and hydroelectric power. The paper mills discharged untreated process wastes to the river that coated the bottom with paper sludge. The use of dyes in the Fitchburg Mills made the river notorious for changing color downstream in accord with the color of paper being manufactured that day.

The City of Fitchburg installed one of the first wastewater treatment plants in the United States (1915). The plant provided secondary treatment, a degree of treatment rare at that time. In 1932, the City of Leominster installed an activated sludge treatment plant for its municipal wastes. However, the industries did little or nothing to treat their discharges, largely negating the attempts by Fitchburg and Leominster to improve water quality. These two towns have combined sewer systems, a type that is purposely designed to overflow to the river during heavy rainfall, further exacerbating pollution problems. The severity of this pollution gave the river the dubious distinction of being the most polluted stream in Massachusetts.

By the 1970s, the Division of Water Pollution Control listed 40 municipal and industrial discharges to the river and its tributaries. There were also numerous potential nonpoint sources of pollution such as urban storm water from Fitchburg, Leominster, Clinton, and Ayer; agricultural runoff (apple orchards); malfunctioning on-site disposal systems; as well as

---

<sup>190</sup> Rev. Abijah Marvin, *History of the Town of Lancaster: From the First Settlement to the Present Time, 1643–1879*, (Lancaster: Published by the town, 1879).

landfills and open dumps near the riverbanks. However, nonpoint source pollution was largely masked by the much more prominent point sources of pollution.

The following is a ranking of the most significant pollutant loads to the river in the early 1970s:

<b>Rank</b>	<b>Waste Load</b>	<b>Receiving Water</b>
1	Fitchburg Paper Mills	North Branch
2	Fitchburg Wastewater Treatment Plant	North Branch
3.	Leominster Wastewater Treatment Plant	North Branch
4.	Clinton Wastewater Treatment Plant	South Branch
5.	Ayer Wastewater Treatment Plant	Mainstem
6.	Fitchburg Combined Sewers	North Branch
7.	Pepperell Paper Mills	Mainstem
8.	Leominster Combined Sewers	North Branch

As can be seen, by the 1970s municipal treatment plants contributed high levels of pollution to the river. These treatment plants were antiquated, overloaded, and provided inadequate treatment of municipal wastewater.

Dams are another factor affecting water quality. They can increase water temperature, increase sedimentation of sludge, decrease oxygen levels and, in some cases, stimulate eutrophication. The North Branch of the Nashua is punctuated by eleven dams. The South Branch has two dams. The Wachusett Reservoir Dam is the largest in the watershed and has been implicated in contributing to water quality problems due to the meager minimum release of water. The mainstem has two dams: the Ayer Ice Company Dam and the Pepperell Pond Dam. The Pepperell Pond impoundment is long (over four river miles) and shallow. River velocities slow in this segment and pollutants settle to the bottom, affording time for biochemical reactions.

## Water Quality in the Early 1970s

The figure below shows the Report Card for water quality in the Nashua River in the early 1970s. The information for this report card comes primarily from a water quality survey conducted by Massachusetts Division of Water Pollution Control 1973 and its Management Nashua Wild and Scenic River Study Committee Draft Stewardship Plan

Plan from 1975. It also draws from a 1975 Management Plan by Camp, Dresser, and McKee Inc., prepared for New England Interstate Water Pollution Control Commission.

Data from the early 1970s serves as a snapshot of water quality before major clean-up efforts were initiated by state and federal programs. Municipal treatment plants in Fitchburg, Leominster, Clinton and Ayer were present, but they were antiquated and ineffective. Industrial pollution was largely unabated.

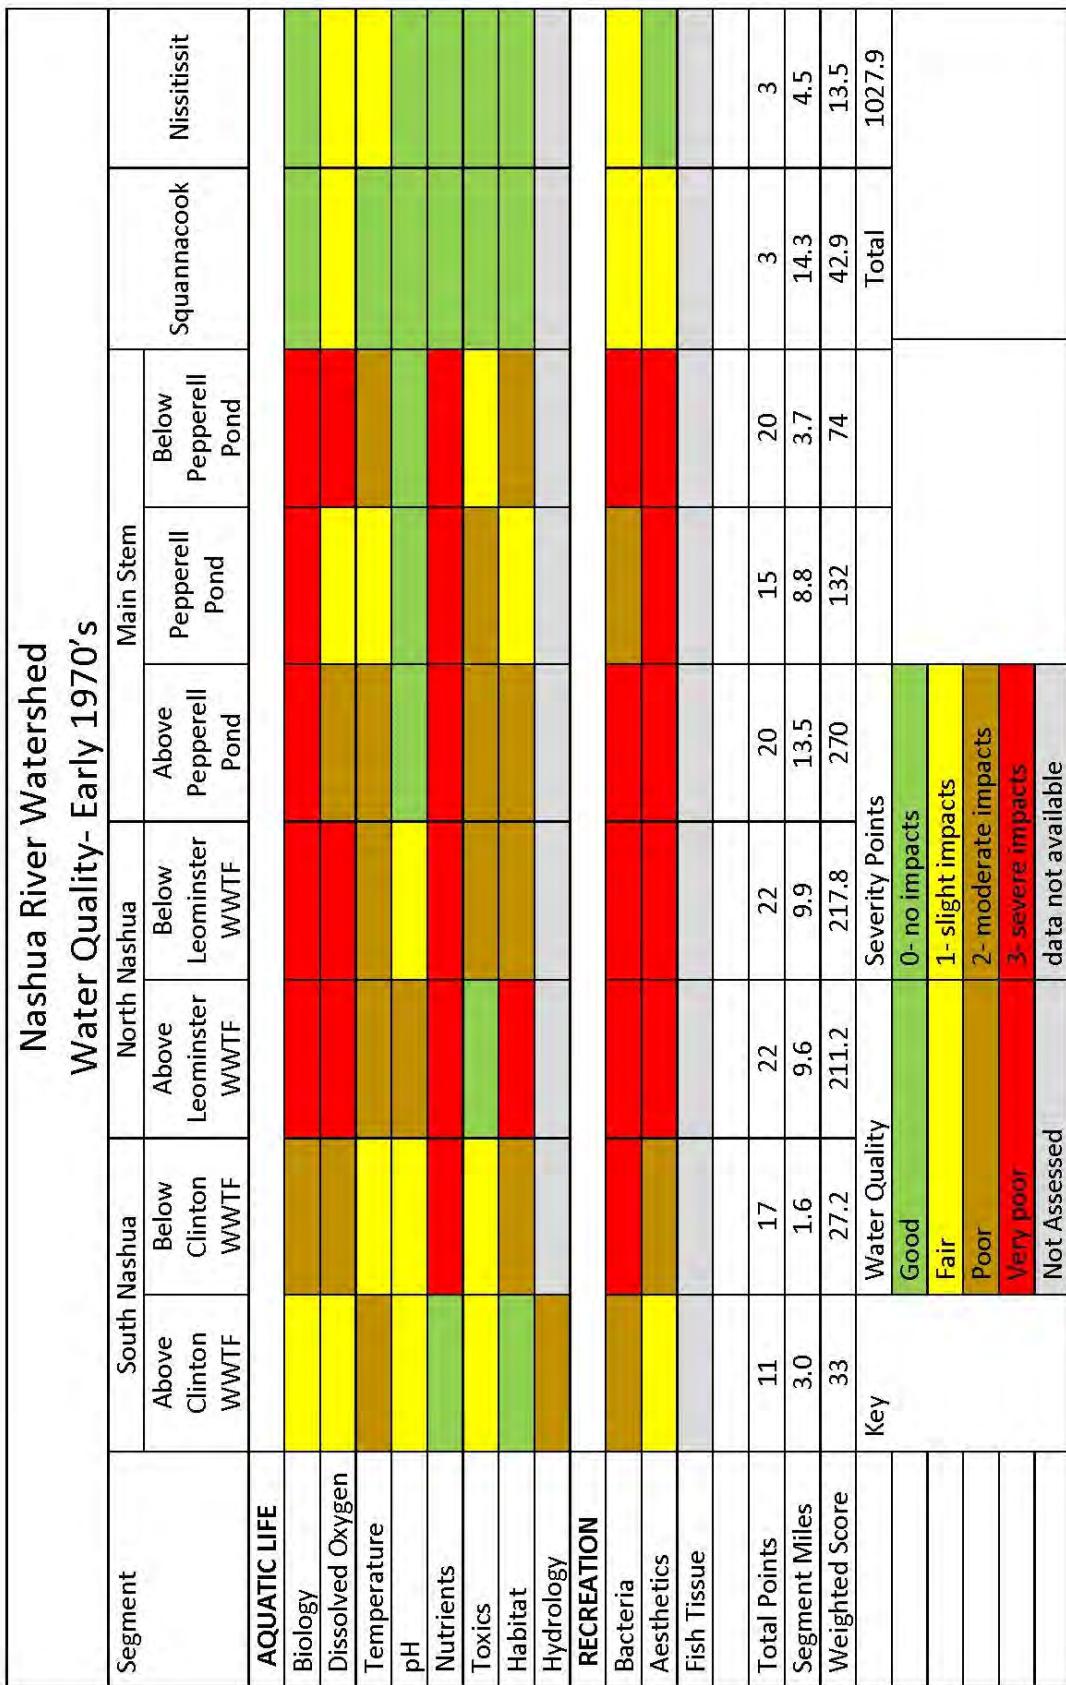

The report card shows that the Nashua River in the early 1970s is biologically dead. Fish cannot live in the river. Dissolved oxygen, necessary for the survival of aquatic life, has been depleted by oxygen-demanding paper waste and sewage. Aquatic habitat has been destroyed by the coating of the river bottom with paper sludge and in the water column with turbidity. Even if fish could survive in the water column, they would not be able to lay eggs and propagate in this degraded habitat. Domestic wastewater has added levels of ammonia to the water column that were toxic to fish.

The most severe pollution is to the North Nashua Branch from the paper mills, municipal systems, and combined sewer overflows. The South Branch also has similar, but not quite as severe, water quality problems. Industrial cooling water discharges on the North and South Branches contribute to high instream water temperature, unsuitable for fish survival. Together, the North and South Branches combine to pollute the Mainstem. The Mainstem shows signs of recovery along its length as the river's natural processes attempted to clean the river, only to be insulted again below Pepperell Pond by more paper mill wastewater.

Recreational uses on the river fare no better than the aquatic life. Bacteria from urban runoff and combined sewer overflows on the North Branch combined with dyes, turbidity, odors, and paper sludge repel people from the river. The South Branch contributes to bacterial problems because the Clinton Treatment Plant is not practicing chlorination at the time. Again, the North and South Branches combine to pollute the Mainstem, with effects lingering through Pepperell Pond. Below Pepperell Pond, more discharges of paper mill wastewater and malfunctioning onsite private septic systems contribute to more degraded conditions.

Compared with the Nashua River, the Squannacook and Nissitissit Rivers are relatively pristine. There are slight excursions from the stringent dissolved oxygen and temperature criteria for coldwater fisheries and occasional elevated bacteria levels from faulty onsite septic

systems. A paper company downstream on the Squannacook River provides generally good treatment for its wastewater, but occasionally contributes to some slight turbidity. These rivers are considered fishable and swimmable in stark contrast to the rest of the assessed waters.

## Water Quality in the Early 1980s

In 1975, the City of Fitchburg completed construction of two new wastewater treatment plants. The Westerly Plant was designed primarily to process paper manufacturing waste. The Easterly Plant was designed to treat domestic wastewater at an advanced level that included both phosphorus removal and nitrification (ammonia removal). Leominster was rebuilding its treatment facility at the turn of the decade to increase its capacity and add phosphorus removal. Pepperell was also constructing a modern facility. Clinton and Ayer were planning upgrades to their facilities.

The upgrades of the Fitchburg treatment facilities make a huge difference in pollution loads to the North Branch. DWPC estimates that total suspended solids are decreased by 90% and oxygen-demanding wastes are decreased by 50%. Bottom deposits of sludge are replaced by pollution-tolerant insects. The river's habitat is recovering but still not up to water quality goals. The dissolved oxygen levels begin to recover in the lower portion of the North Branch but are again depressed when it joins the South Branch. They then recover in Pepperell Pond and remain good in the lower portion of the river. Temperature problems in the river are largely eliminated.

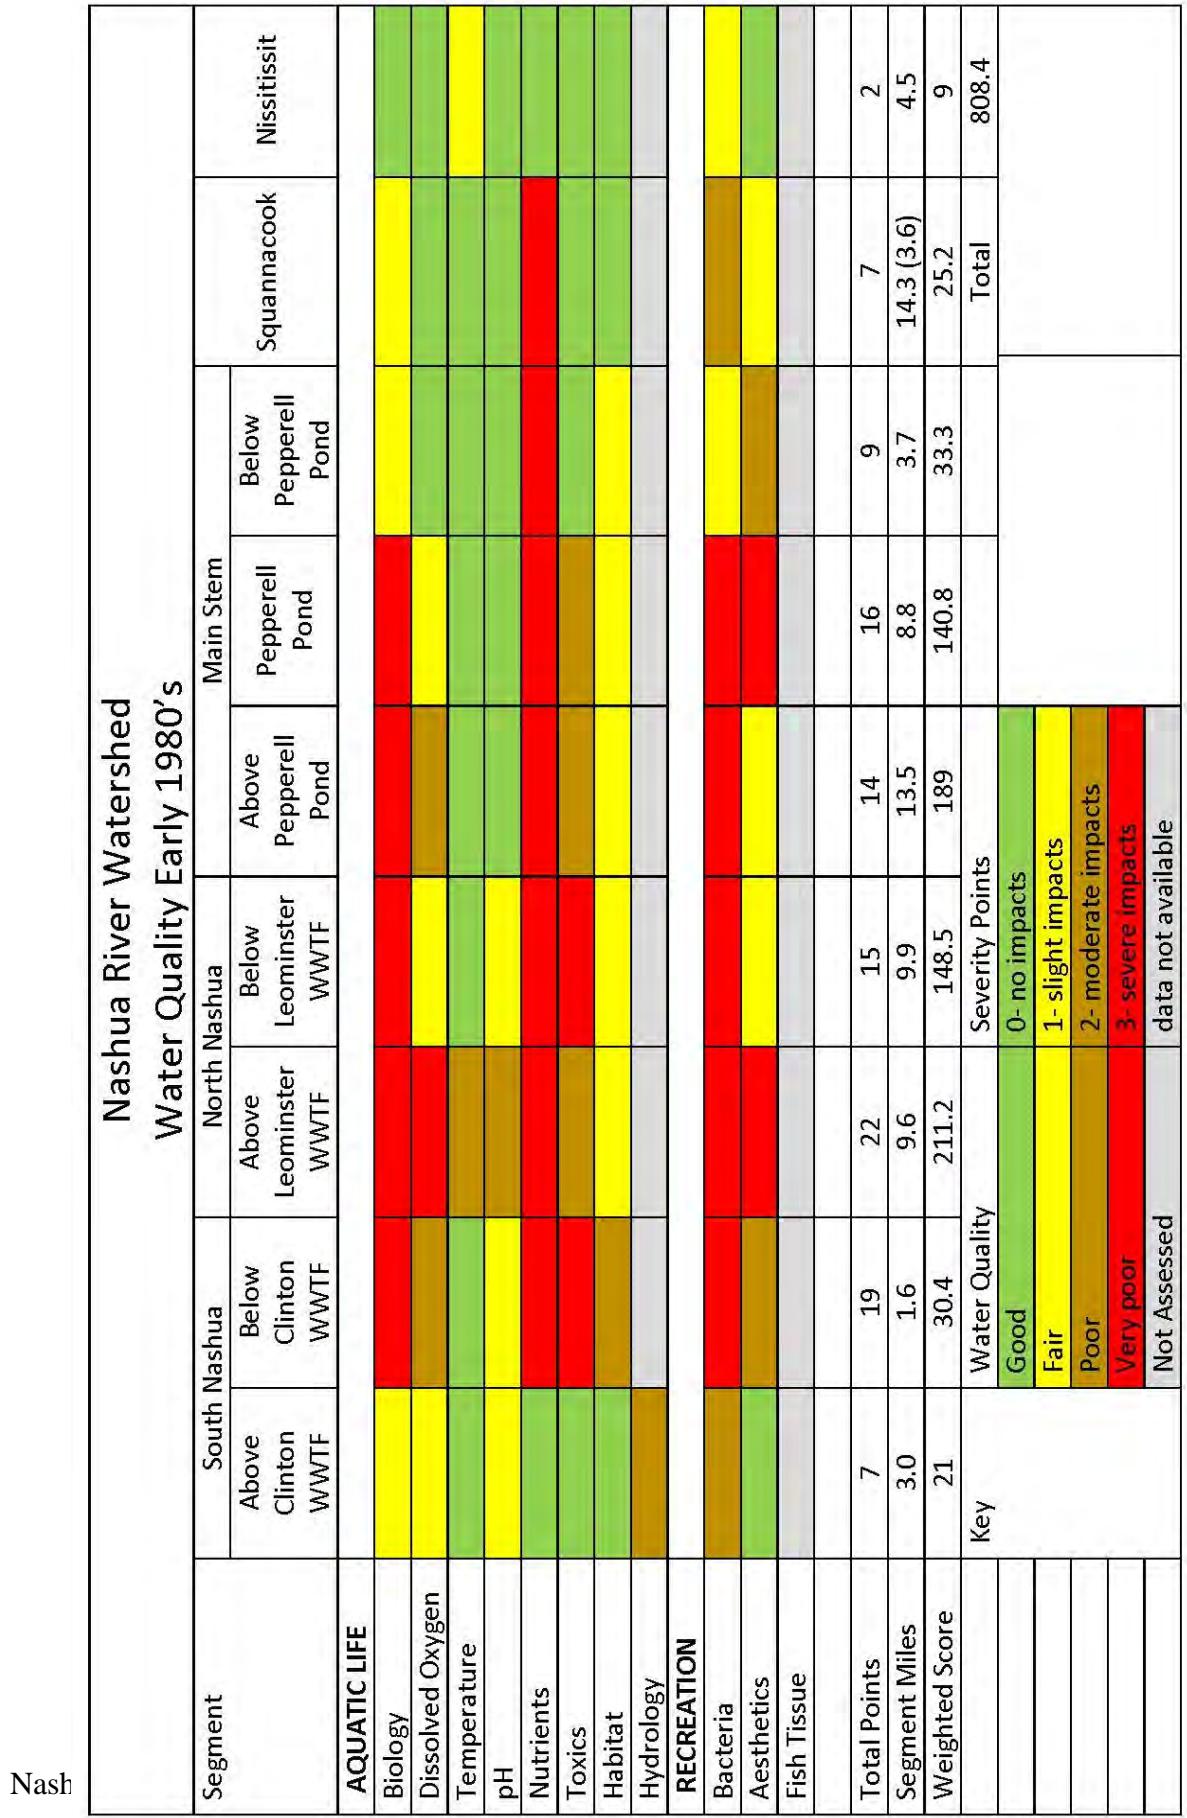

Recreational uses of the river remain impaired. Urban runoff and combined sewer overflows keep bacterial levels high on the North Branch. In the South Branch, bacterial levels remain high until the Clinton Treatment Plant adds chlorination to its treatment process. Start-up problems with this upgrade, however, contribute to toxicity problems in the river. The removal of sludge in the North Branch reduces aesthetic nuisance conditions considerably. The North Branch recovers considerably in its lower segment and even the turbidity from South Branch does not diminish the recovery.

Aesthetic problems are less severe in the Mainstem. However, as Pepperell Pond recovers from one type of pollution, it becomes susceptible to another. The abundance of nutrients compiled in the sediments contributes to sever eutrophication of the pond. Nuisance vegetation, such as duckweed, covers the surface of the impoundment, impairing recreational uses.

In the Squannacook River, nutrients in the lower part of the river create some slight aesthetic issues. Faulty septic systems continue to be an issue. The Nissitissit River is referred to by

DWPC in 1977 as one of the cleanest rivers in the state. Minor temperature and bacteria excursions from criteria are noted in the survey data.

In the Nashua River Watershed, the recovery from the 1970s is evident. Two segments, the South Branch above Clinton and the Mainstem below Pepperell Pond, are largely fishable and approaching swimmable. The rest of the river is still not fishable/swimmable but improvements are evident. The total weighted severity points for the system drop from 1027.9 to 808.4, a better than 20% improvement. The appearance of more green areas on the report card shows that most of these improvements were to the aquatic life use.

## Water Quality in the Mid 1990s

The information for this report card (below) comes from a comprehensive survey conducted in 1998 by the Massachusetts Division of Watershed Management, the Massachusetts Water Resources Authority, the Nashua River Watershed Association and the U.S Environmental Protection Agency.

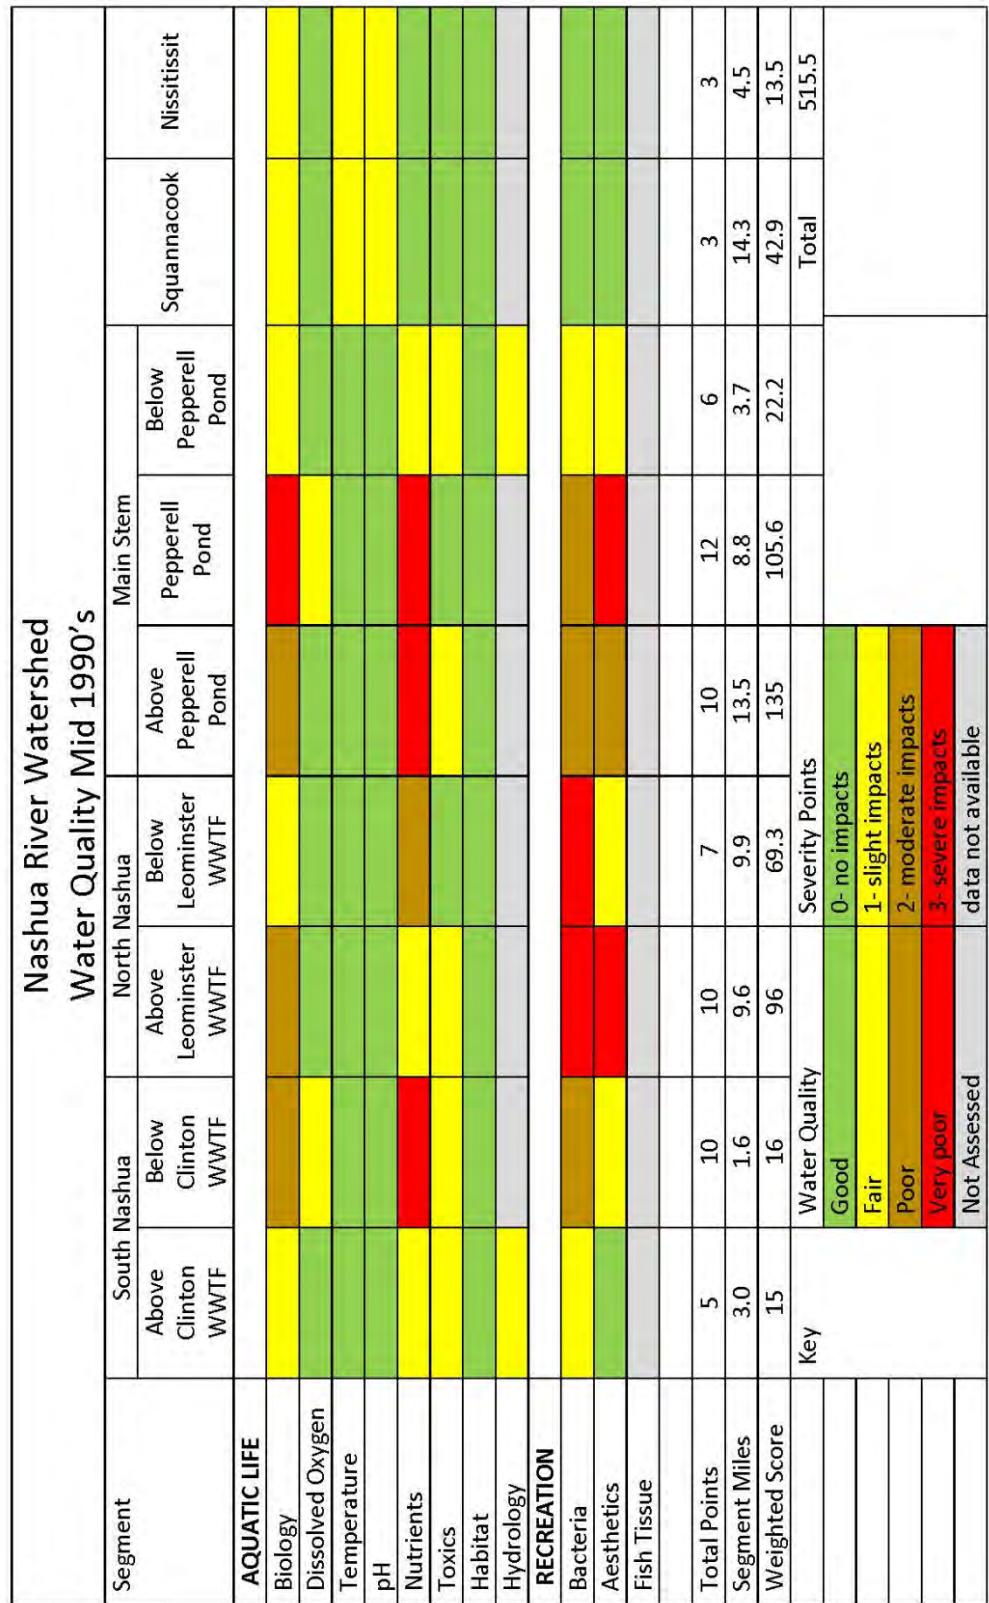

In the South Branch, urban runoff causes slight problems above the Clinton treatment plant, but problems below the plant persist because of lack of instream dilution and high nutrient loadings from the facility. Recreational uses continue to be impaired by urban runoff.

Remarkably, the North Branch, once the most polluted system in the Nashua River Watershed, now has recovered to pollution levels equal to or below other portions of the river. This can be seen by examining the total severity points in the various segments. Above Leominster, the two Fitchburg facilities have drastically reduced pollution in the river, but the combined sewer overflow problems have not been addressed. The aquatic life is impacted by apparent instream toxicity, perhaps from a legacy of pollutants trapped in the sediments. Recreational uses are impaired by the bacteria, turbidity, and odors from the combined sewer overflows. Below Leominster, nutrients from the treatment facility and continued impacts by combined sewers impair uses.

In the mainstem of the river, carryover pollution from the North and South Branches and high nutrient levels from the Ayer treatment facility contribute to water quality problems above Pepperell Pond. Within the pond, recycling of nutrients creates a highly eutrophic condition with the water becoming choked with nuisance vegetation. This, in turn, reduces benthic dissolved oxygen and adversely affected aquatic life. Very poor aesthetic conditions adversely affect recreation. In terms of total severity points, Pepperell Pond now becomes the most polluted segment of the river. Below Pepperell Pond, carryover pollution from the pond and rapid flow fluctuations from the hydropower operation are sources of problems but these are characterized as slight.

Both the Nissitissit and the Squannacook Rivers have slight temperature and pH perturbations causing slight impacts to aquatic life. The water quality problems of the Nashua River are shifting from the impacts from paper companies and municipal wastewater on the North Branch to the impacts of combined sewer overflows (CSO) on the North Branch.

CSO's were once ranked sixth most important source of pollution. These impacts carry over to the mainstem of the river. Nutrients remain high through most of the watershed due to inadequate removal at municipal facilities and from the combined sewer overflows. The focus of abatement actions in the watershed is shifting from the North Branch to the Clinton facility and to Pepperell Pond. The weighted severity points for the watershed show an approximate 50% reduction in pollution from the early 1970s—a remarkable achievement.

## Water Quality in the Early 2000s

The information for this report card (below) comes primarily from the Massachusetts Department of Environmental Protection' 2003 Assessment Report or the Nashua River Watershed Association. The South Branch above the Clinton wastewater facility was assessed as fishable/swimmable, although there are some lingering concerns about flow releases from Wachusett Reservoir. Below the facility, phosphorus concentrations are still high due to the discharge and there are slight impacts to recreational uses from urban runoff.

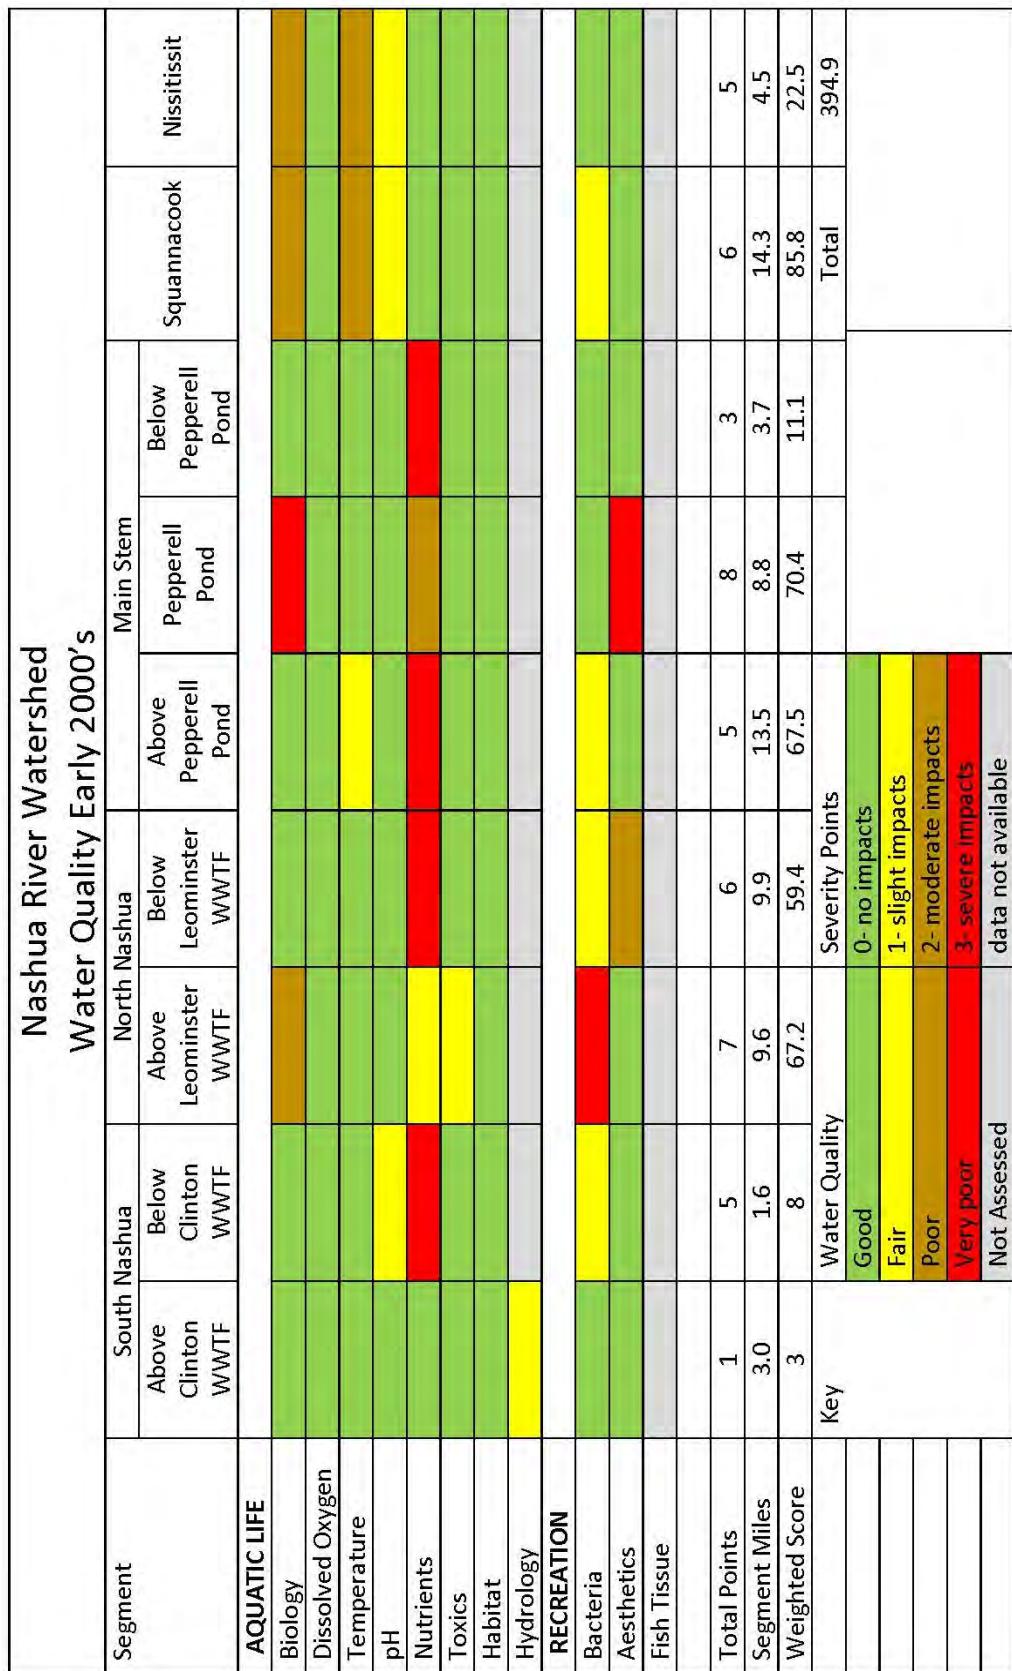

In the North Branch, evidence of instream toxicity persists in the segment above Leominster, impairing aquatic life. Recreational uses suffer from the continued discharge of combined sewer overflows. Below Leominster, nutrients levels are high due to municipal wastewater discharges and aesthetic concerns are derived from odors from combined sewer overflows. The severity points show that the pollution level on the North Branch is about a third of the level of the early 1970s.

In the Mainstem of the river, nutrient levels remain high due to carryover from upstream sources and recycling from the sediments in Pepperell Pond. The adverse effect of these nutrients are largely shown in Pepperell Pond, in the form of massive blooms of nuisance and nonnative vegetation. This condition impairs both the aquatic life and recreational uses of the waterbody. Pepperell Pond continues to be the focus of pollution issues in the river with other sections of the Mainstem generally reaching fishable/swimmable status.

The most recent fish sampling both the Squannacook and Nissitissit Rivers displays a lack of coldwater species. This is disturbing, for these rivers are thought to be relatively pristine. Water quality monitoring reveals higher-than-desired temperatures for coldwater populations. The source of this impairment is unknown and suspected sources include dams, beaver activity or climate change.

The South Branch, North Branch, and Mainstem of the Nashua River have undergone an approximate 70% reduction in pollution levels during the period of the early 1970s to the early 2000s, as demonstrated by the weighted score on the report cards. This dramatic reduction is largely brought about by the treatment of industrial and municipal wastewater mandated by the National Pollutant Discharge Elimination System permit program. The problems that persist are largely due to high phosphorus levels and untreated combined sewer overflows. The

phosphorus levels are from several municipal wastewater sources but adverse effects are largely exerted in Pepperell Pond. The combined sewer overflows are on the North Branch but effects carryover to the Mainstem.

**Table 1: Nashua River Watershed Water Use Classifications (by Warren Kimball)**

Segment Number	Description	River Miles	Classification			Early 1970's Condition
			1967	1974	1978	
1	<b>South Branch</b> Outlet Lancaster Mill Pond, Clinton, to Clinton WWTF, Clinton	3.0	B	B	B	U
2	Clinton WWTF to confluence with North Nashua River, Lancaster	1.6	C	B1	B	U
3	<b>North Branch</b> Fitchburg Paper Co. Dam #1, Fitchburg to Leominster WWTF, Leominster	8.4	C	C	B	U
4	Leominster WWTF to confluence with the Main Stem Nashua River, Lancaster	9.9	C	C	B	U

## APPENDIX D: Special Designations in the Massachusetts Portion of the Nashua River Watershed

by Warren Kimball

The Nashua River and its tributaries have received numerous designations by Massachusetts agencies that substantiate its significant resource value. This Appendix describes several special designations that are most relevant to this Wild and Scenic Rivers study.

### Outstanding Resource Waters

Outstanding Resource Waters (ORWs) are designated in the Massachusetts Surface Water Quality Standards [314 CMR 4.04(3)]. These waters are determined by the Massachusetts Department of Environmental Protection based on their outstanding socio-economic, recreational, ecological and/or aesthetic values. These are waters whose high quality will be protected and maintained. With minor exceptions new or increased discharges of pollutants are prohibited to these waters assuring that existing high water quality is preserved. Those waterways designated in the Squannacook and Nissitissit Rivers Sanctuary – see below -- are designated as ORW's.

### Coldwater Fisheries Resources

A Coldwater Fisheries Resource (CFR) is a body of water that is used by coldwater fish species to fulfill one or more of their life history requirements. These species include trout and slimy sculpin, among others. These fish require cold, well-oxygenated water and suitable habitat for spawning, feeding and refuges. Such requirements make these habitats particularly sensitive to alterations or pollution. Changes in land and water use can reduce the ability of these waters to support coldwater fish. The Massachusetts Division of Fisheries and Wildlife identifies CFR's and maintains a list that is updated annually.

Coldwater Fisheries are also designated in the Massachusetts Surface Water Quality Standards (SWQS) and are given more stringent temperature and dissolved oxygen criteria than other inland waters. However, these SWQS regulations (314 CMR 4.00) are updated less frequently and do not reflect the most recent information available from Massachusetts Fish and Wildlife.

There are 90 CFR's in the Nashua River watershed, although many are unnamed streams, since naming a water body as a CFR is generally considered to include its unnamed tributaries.

## **Areas of Critical Environmental Concern**

Areas of Critical Environmental Concern (ACEC) are designated by the Massachusetts Executive Office of Environmental Affairs pursuant to 301 CMR 12.00. ACEC's are those areas within the Commonwealth where unique clusters of natural and human resource values exist and which are worthy of a high level of concern and protection. The aim is to preserve and restore these areas and all EOEEA agencies are directed to take actions with this in mind.

Three ACEC's exist in the Nashua River Watershed:

- The Squannassit ACEC includes over 37,000 acres on the west side of the Nashua River in Ashby, Ayer, Groton, Harvard, Lancaster, Lunenburg, Pepperell, Shirley and Townsend.
- The Petapawag ACEC includes over 25,000 acres in Ayer, Dunstable, Groton, Pepperell and Tyngsborough on the east side of the Nashua River.
- The Central Nashua River valley ACEC contains nearly 13,000 acres in Bolton, Harvard, Lancaster and Leominster.

It is important to state that the Nashua River corridor is a central feature of all three ACEC's.

## **The Squannacook & Nissitissit Rivers Sanctuary**

The Massachusetts General Laws Chapter 132A, Section 17 establishes the Squannacook and Nissitissit Rivers Sanctuary (SNRS). The sanctuary comprises the surface waters of both rivers and their tributaries. A small section of the Squannacook River is excluded: from the Hollingsworth and Vose Dam to the confluence with the Nashua River.

In these sanctuary waters, no new discharge of treated or untreated sewage or other wastewater is permitted. Storm water discharges and conveyances must be approved by the planning board and conservation commissions of the affected towns. The Attorney General has the authority to enforce these rules. This sanctuary was subsequently designated as an ORW in the Surface Water Quality Standards underscoring the desire to preserve these waters.

## APPENDIX E: Special Designations of Massachusetts Rivers and Tributaries

by Warren Kimball

This Appendix lists the Massachusetts-recognized water bodies that are located entirely or partially within the Wild and Scenic Rivers area. The following table gives the river mileage and special designation for each river and tributary. (See abbreviations below.) There are more miles of the Nashua and Nissitissit Rivers in NH that are not included below.

Outstanding Resource Waters (ORWs)

Coldwater Fisheries Resource (CFR)

Areas of Critical Environmental Concern (ACEC)

Squannacook and Nissitissit Rivers Sanctuary

Stream Name	Miles	ORW	CFR	ACEC	Sanctuary
Nashua River	30.5			X	
Unkety Brook	6.5		X	X	
Reedy Meadow Brook	2.2		X	X

## APPENDIX F: Noteworthy Federal Involvement in the Nashua River Watershed

The Nashua River as a tributary of the Merrimack River is listed as part of the North American Atlantic Salmon Anadromous Fish Program. The Nashua River is also recognized as having international importance as a migratory flyway as it provides breeding and migration habitat for migratory waterfowl in the form of open palustrine and emergent wetlands. The extensive and regionally significant wetlands occurring on and adjacent to the Oxbow National Wildlife Refuge (ONWR), including its associated tributary headwaters, have been listed as a priority for protection under the Emergency Wetlands Resources Act of 1986 (P.L.) 99-645 (100 Stat. 3582). It is also named as a priority for protection due to their importance to the Atlantic Flyway for migrating birds under the North American Waterfowl Management Plan: an agreement between Canada, Mexico, and the United States. Indeed, the ONWR was initially created to support the national migratory bird management program. In 2016 the “Bill Ashe Visitor Facility” at ONWR and associated boat launch on the Nashua River were built.

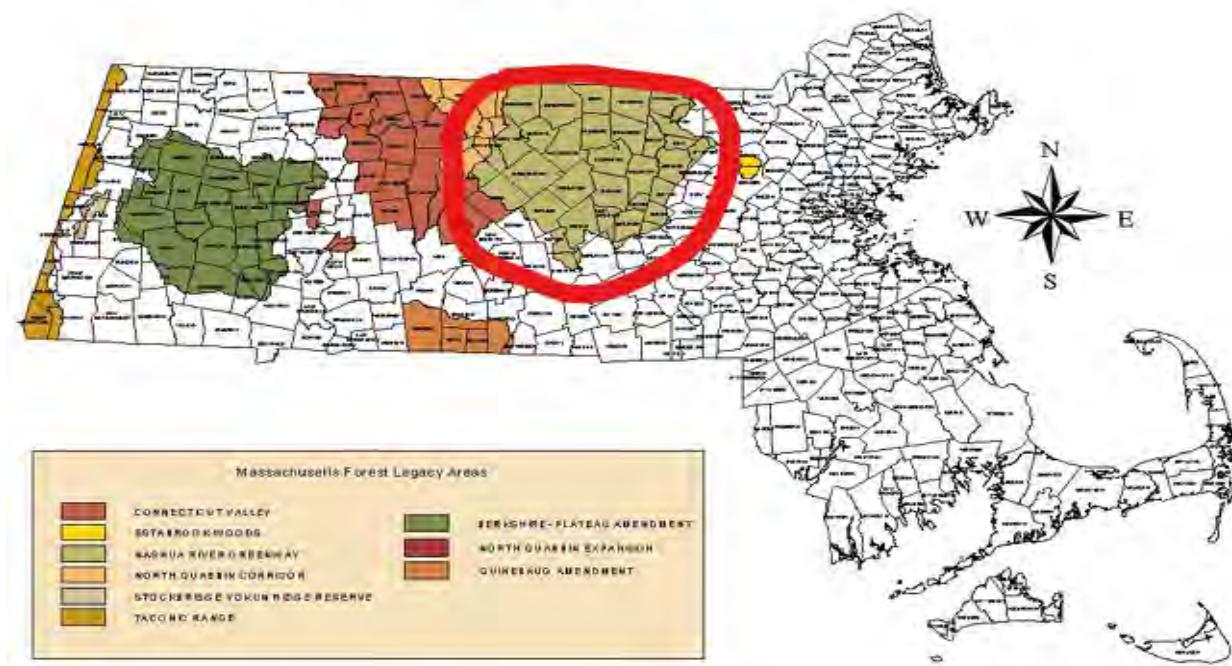

The Nashua River is listed in the 1987 US Environmental Protection Agency (EPA) Priority Wetlands of New England, in recognition of the value of its wetland habitats to northeast waterfowl populations (*Central Nashua River ACEC Nomination Report*, pg. 10). As we understand it, the US Fish and Wildlife Service (USFWS) is pursuing a goal to reintroduce alewife and American shad to the Nashua River in the next ten years (personal communication with Michael Bailey, USFWS Assistant Project Leader, 2016) and has a river herring restoration program in place on the Nashua River: passage for river herring may be required in the future. The USFWS has already stocked alewife and American shad in Lake Potanipo, Brookline New Hampshire headwaters of the Nissitissit River since 2014.

As part of the large scale plan for fish restoration in the Merrimack River, the Nashua River Watershed is a current and future release location for river herring. Anadromous fish restoration is a cooperative effort among state agencies including the Massachusetts Division of Marine Resources, MassWildlife, and federal agencies including the Service, National Marine Fisheries Service and U.S. Forest Service. The Nashua River is considered a self-sustaining river in that it has existing fish passage facilities at dams which need to be modified or improved as part of the plan. This watershed will also be monitored and evaluated to ensure effective and efficient upstream and downstream passage of fish. Fish that would benefit from this effort include the

river herring (*Alosa pseudoharengus*), American shad (*Alosa sapidissima*) and American eel (*Anquilla rostrata*).<sup>191</sup>

Nearly the entire Nashua River watershed has been included as the “Nashua River Greenway Forest Legacy Area” under the US Forest Service administered Forestry Legacy Program in partnership with Massachusetts Department of Conservation and Recreation’s Bureau of Forestry (see [www.mass.gov/eea/docs/dcr/stewardship/forestry/other-reforest/nashua-river-greenway-expansion-2001.pdf](http://www.mass.gov/eea/docs/dcr/stewardship/forestry/other-reforest/nashua-river-greenway-expansion-2001.pdf)).

## MASSACHUSETTS FOREST LEGACY AREAS

Note: This Forest Legacy Area met the eligibility criteria for a Forest Legacy Area as follows:

1. Forests are threatened by immediate and future conversions to non-forest, house lots.
2. Individual landowners have been approached about selling conservation easements and are interested in selling easements.
3. Scenic resources ... are recognized as distinctive.

<sup>191</sup> USFWS Oxbow National Wildlife Refuge, Final Comprehensive Conservation Plan, Feb. 2005, pg. 33

4. Public has traditionally utilized the ... areas for recreation and these are opportunities to extend the existing greenway systems.
5. Numerous private wells, six public water supply wells, and designated Zone 2 drinking water protection areas lie within the sections -- protection of the water supply sources.
6. Riparian habitat for fish, waterfowl and migratory songbirds, and associated forested wetland plants and animals.
7. Contain rare and endangered flora and fauna.
8. Provide river access to all types of passive recreation including fishing.
9. Contain significant historic sites and potential sites of archeologic importance.
10. Have highly productive floodplain soils for forestry and agriculture.

There are two Forest Legacy protected tracts in our study area: Belmont Springs tract (bisected by Gulf Brook, a tributary to Nissitissit River; 255 acres in Pepperell) and Pumpkin Brook Link tract (tributary to Squannacook River; 174 acres in Shirley).

The Nashua, Squannacook, and Nissitissit Rivers are all included in the federally designated Freedom's Way National Heritage Area (FWNHA) as are all our participating towns. The FWNHA extends from metro-Boston, through the site of "the shot heard round the world" in Concord, to Mount Wachusett. One ongoing project is to build a trail following Henry David Thoreau's famous 1842 walk there through Bolton, Lancaster, and the Still River village within Harvard. FWNHA describes itself as:

...intimately tied to the character of the land as well as those who shaped and were shaped by it. Here landform and climate combined to create an environment propitious to settlement, with a network of natural features, including river systems and forests, sustaining successive generations of inhabitants. Like veins on a leaf, the paths of those who settled the region are connected, providing both tangible and intangible reminders of the past. Their stories can be found on village commons, along scenic roadways lined with stone walls, in diaries and artifacts, in a cabin by a pond, along a battle road or hidden deep within a secret glen by the bank of a meandering river.<sup>192</sup>

In regards to previous federal grant-awarded projects in our study area, the Environmental Protection Agency (EPA) Targeted Watersheds Grants program funded the Nashua River

---

192 <http://freedomsway.org/redesign2/>

2004-2007 “Protecting Today’s Water for Tomorrow: Combating Threats to Source Water in the Squannacook Nissitissit Sub-basin of the Nashua River Watershed” project. The NRWA and three partner organizations—Beaver Brook Association, New England Forestry Foundation, and the Trust for Public Land—were one of only fourteen awarded nationwide to combat threats to drinking water and protecting key water resources by conserving key land parcels. The project was highlighted in The Trust for Public Land’s *Source Protection Handbook Using Land Conservation to Protect Drinking Water Supplies*, 2005. This project built upon an earlier federal EPA 2001 Source Water Stewardship Project focused on the Squannacook-Nissitissit Rivers: one of four such sites awarded nationally.

Finally, there are two US Geologic Service (USGS) river gages in our area: one on the Nashua River in East Pepperell

[https://waterdata.usgs.gov/ma/nwis/uv/?site\\_no=01096500&PARAmeter\\_cd=00065,00060](https://waterdata.usgs.gov/ma/nwis/uv/?site_no=01096500&PARAmeter_cd=00065,00060)

and one on the Squannacook River in West Groton

[https://waterdata.usgs.gov/nwis/uv?site\\_no=01096000](https://waterdata.usgs.gov/nwis/uv?site_no=01096000). The former gage has been operating and providing water flow records since 1935; the latter gage has been there since 1949 and is considered by USGS to be a reference gage which is described as follows:

[l]ong periods of unmodified streamflow, ... natural forest and wetland landcover with no water withdrawals, return flows, dams, or development. Few stations in southern New England meet these criteria, however, given population the density and history of land use in the region. GIS data for water withdrawals, water returns, dams, and land-use characteristics were evaluated to indicate difference in potential flow alteration in records for selected stations in MA.<sup>193</sup>

---

<sup>193</sup> Characteristics and classification of least altered streamflow in MA. Armstrong, D.S., Parker, G.W. and Richards, T.A. USGS Scientific Investigations Report 2007, pg 11.

## APPENDIX G: Existing Major Protected Conservation Areas in the Towns in the Stewardship Plan

River Segment	Protected Area	Acreage	Features
Nashua Mainstem in MA	Bolton Flats WMA	~1,335	<p>“...extends along the Nashua River in Harvard, Lancaster, and Bolton. The river here is slow and meandering, with adjacent High-Terrace Floodplain Forest and Low-Energy Riverbank. The combination of a slow river, floodplain forest, and dry sand makes for excellent turtle habitat. In fact, 3 state-listed rare turtle species Blanding's Turtles, Wood Turtles, and Spotted Turtles have all been documented from this stretch of river.”</p> <p>Also see  <a href="http://www.mass.gov/eea/agencies/dfg/dfw/wildlife-habitat-conservation/habitat-restoration-key-sites.html#bolton">www.mass.gov/eea/agencies/dfg/dfw/wildlife-habitat-conservation/habitat-restoration-key-sites.html#bolton</a></p>
	Oxbow National Wildlife Refuge	~1,667	<p>“...particular value in carrying out the national migratory bird management program....” along nearly 8 miles of the Nashua River, the Refuge’s interspersion of wetland, forested upland and old field habitats is ideally suited for this purpose. There are a number of non-contiguous sections in Shirley, Ayer, Harvard &amp; Lancaster on both sides of the river, some of which was acquired as part of the decommissioning of portions of Fort Devens. Rare species. Hunting &amp; the fact that the Refuge has different rules (no dogs, etc....)</p>
	Portion of Mulpus Brook WMA	124-acres portion of 517-acre total	Mulpus Brook is an important coldwater tributary to the Nashua. However, note that the majority of Mulpus Brook WMA is outside the ¼ mile corridor of the Nashua River.
	J. Harry Rich State Forest	~679	<p>“...along the Nashua River is a wooded with broad level trails for easy walking. It offers excellent views of the river and surrounding area as it winds along the banks” through a portion of which linear Nashua River Rail Trail passes. One of the few state-owned tree farms in the nation and one of the first such in MA....and described as “...the most intensively managed forest acreage in New England”.</p> <p><a href="http://www.nashuariverwatershed.org/recreation/hiking-walking.html">www.nashuariverwatershed.org/recreation/hiking-walking.html</a></p>

River Segment	Protected Area	Acreage	Features
	Groton Town Forest	~513	“...provides protection for the watershed, educational activities, recreation, and wildlife habitat...created by vote of the Town Meeting in 1922, was among the first dozen such town forests in the Commonwealth”. As part of the Surrenden Farm protection effort, the town of Groton granted the MA Dept of Fish & Game a Conservation Restriction on the Groton Town Forest, thereby opening it up to hunting and permanently protecting it as open space.
	Sabine Woods and Groton Place (abutting properties)	~146 and ~54, respectively	“...owned and managed by the New England Forestry Foundation (NEFF), is a former estate featuring open fields and river vistas, broad trail.... with ~1,800 feet of frontage on the east side of the Nashua River...proclaimed “Wild Life Sanctuary for The Benefit and Pleasure of the People of Groton”.
	Ayer Game Farm & MA DFW NE Headquarters	~116 91 + 15.7	Previously used to raise pheasants for stocking, this property is now used as offices for the DFW Office of Fishing & Boating Access. This property directly abuts the Groton Town Forest and Surrenden Farm. Another section abuts the DFW Northeast District Headquarters.
	Surrenden Farm/General Field	~325	Sitting prominently in a 1,500-acre block of contiguous protected open space, 360-acre Surrenden Farm was Groton's highest conservation priority until it was purchased by the town and several conservation organizations in 2006. With 3/4 mile of Nashua River frontage, forest and scenic rolling hayfields, Surrenden Farm had been one of the largest remaining unprotected landscapes in town. The General Field is 143 acres of agricultural land that has survived since early colonial times. DFW has a CR on 10 acres of Groton Water Dept. land and a Conservation Restriction on 159 acres on Surrenden Farm West.
	Unkety Brook WMA	Portion = 185 acres of a total of 527 acres	In Dunstable and Pepperell, a 185-acre portion of the Unkety Brook WMA is located along the eastern bank Nashua River. These parcels lie between the river and DCR's rail trail, providing important wildlife habitat south of the confluence of Unkety Brook with the Nashua.

River Segment	Protected Area	Acreage	Features
Nissitissit in MA	Nissitissit River WMA	~447 acres 22 parcels acquired from 1974 to 2017	Very popular for catch and release, hunting, bird watching, and hiking on abandoned rail bed which runs along the river. The section of the river from the NH border to the Prescott bridge in Pepperell is one of only 9 designated catch & release areas in the state. In addition, in this section anglers must use a conventional fly rod and fly line. The former Turner dam was removed in 2015, benefitting fish passage and restoring coldwater habitat.
		~309 acres total (with ~ 171 acres in Brookline and ~138 acres in Hollis)	The Brookline parcels are held by the Town of Brookline Conservation Commission, Beaver Brook Association and the Nissitissit River Land Trust. The Hollis parcels are held by Beaver Brook Association and the Nissitissit River Land Trust. These holdings are nearly contiguous along the entire river.
Squannacook in MA	Squannacook River WMA, WCR and WCE	~1,934 comprised of 1,641 in fee, 49 parcels from 1965 to 2017	This non-contiguous WMA extends from Shirley through Groton & Townsend to Ashby, consisting of almost 50 different fee-owned parcels. The Squannacook WCR is a 68-acre donated restriction on development of the South Fitchburg Hunting & Fishing Club that does not allow public access. The Squannacook WCE consists of 4 Conservation-Restricted parcels totaling 299 acres which are open to the public, 2 in Shirley at the confluence with the Nashua and 2 in Townsend, 1 of which is located in the headwaters. (2,008 total)
	Townsend State Forest	~3,082	Non-contiguous parcels owned by the MA Dept. of Conservation & Recreation. Portions are located across the river from & adjacent to portions of the Squannacook River WMA, while other large blocks extend away from the river to the NH border & include many small tributaries to the river & hiking trails.
	Willard Brook State Forest	~2,930	
	Bertozzi Conservation Area	~56 (42 acres in Groton and 14 acres are across the river in Shirley)	Municipal land adjacent to state Squannacook River WMA; popular swimming hole.

(E=Endangered, T=Threatened, SC=Special Concern)

The official list of Endangered, Threatened, and Special Concern species as defined in Section 10.60 of Chapter 321 of the Code of Massachusetts Regulations. The MESA List is prepared under the authority of the Massachusetts Endangered Species Act (MESA). Under this act (MGL c. 131A and its implementing regulations (321 CMR 10.00)), MESA-listed species are protected from "take."<sup>194</sup>

---

<sup>194</sup> "Take is defined as the following: In reference to animals, means to harass, harm, pursue, hunt, shoot, hound, kill, trap, capture, collect, process, disrupt the nesting, breeding, feeding or migratory activity or attempt to engage in any such conduct, or to assist such conduct,....and in reference to plants, means to collect, pick, kill, transplant, cut or process or attempt to engage or to assist in any such conduct. Disruption of nesting, breeding, feeding or migratory activity may result from, but is not limited to, the modification, degradation or destruction of Habitat." On the Nissitissit River:

West Hollis Road Launch

## APPENDIX J: Archaeological Sites in the Former Fort Devens Area

As of 2013, there were 20 recorded pre-contact Native American archaeological sites within the former Fort Devens section of the Nashua River drainage. All of these sites were identified as a result of local collector activities going back to the early 1940s and Cultural Resource Management (CRM) investigations conducted within the former Fort Devens lands in the past two decades. These sites include five areas along the Catacoonamaug Brook near its confluence with the Nashua River, which represent probable short-term, task-specific occupations, and two sites along Nonacoicus Brook near its confluence with the Nashua River, which may be larger year-round base camps.

Based on the data collected through avocational activities, academic archaeological studies, and CRM surveys, generalizations about site types and distribution within the Nashua River drainage can be made. Archaeological and documentary evidence of pre-contact settlement patterns and land use in the Nashua River valley spans the earliest human occupations during the PaleoIndian Period (ca. 10,000 years before present [B.P.]) through the Late Woodland (ca. 1000 B.P.) and contact (ca. 400 B.P.) periods. Native American populations appear to have exploited the diverse natural resources of the Nashua River valley. Settlement/land use patterns associated with temporal periods or specific cultural groups consisted of sites of varying internal complexity and size. These include large base camps, as well as less complex sites of various sizes used temporarily during hunting or other foraging and resource collection activities and lithic manufacture.

Also as of 2013, there were 89 recorded post-contact Euro-American archaeological sites within the former Fort Devens section of the Nashua River in the towns of Ayer, Harvard, Shirley, and Lancaster. Most of these sites appear on eighteenth and nineteenth century town maps and consist of residential home-farmsteads related to former villages and neighborhoods. For example, the lands on the east side of the Nashua River on the former Fort Devens Main Post were formed from lands situated in the northwestern portion of the town of Harvard, historically known as the Shabikin District. This historic neighborhood was on the periphery of the principal civic-institutional and manufacturing village centers in the town and attempted to succeed to the town of Shirley in the mid-1700s. It contained scattered home-farmsteads during

the eighteenth and nineteenth-centuries, most of which were still standing at the time of military acquisition for the formation of Camp Devens in 1917.

In addition to recorded residential and small-scale industrial (mill) sites, expected types of undocumented early Euro-American sites in this same general area could include scattered farmsteads, garrison houses, fur trading posts (locally known as truck houses), and saw/gristmill features. The archaeological remains of such sites would typically consist of cellar holes and dry-laid fieldstone foundations related to wood-frame structures, privies, wells, animal pens, dams, wheel pits, tail and head races, and associated artifact assemblages (domestic, architectural, and/or trade-good items).

Suzanne G. Cherau, MA, RPA

Senior Archaeologist/Principal Investigator

## APPENDIX K: Highlights of Outreach Events, Forums, and Activities through February 15, 2018

(Disclaimer: Outreach events that occurred after February 15, 2018 are not included here, but will be listed in the National Park Service's Study Report to Congress and will be listed on our website: [www.wildandscenicnashuarivers.org](http://www.wildandscenicnashuarivers.org) )

### Paddle on the Nashua River

Photo: Cindy Kno

**Join Nashua River Wild and Scenic Study Committee members on a free paddle. Pre-registration required.**

**Monday October 16 — 4:00 to 5:30 PM**

(Raindate in case of inclement weather Wednesday October 18)

**Nashua River launching from Nashoba Paddler, LLC**

398 West Main Street, Groton, MA 01450

The one-mile stretch of the river we will paddle passes by Groton Place/ Sabine Woods Groton Town Forest, Groton School boat house, Surrender Farm, Dead River and more. Join other local officials in learning about the "Outstandingly Remarkable Resource Values" (ORRV's) on the Nashua to see first-hand and up-close the many that make our rivers eligible for National Park Service Wild & Scenic status. There is perhaps no better way to appreciate these ORRV's than from a boat on the river itself. This is a unique opportunity to get acquainted with our rivers' natural, cultural, historic, recreational and scenic characteristics in the company of one's municipal colleagues and counterparts. This is a great time of year to paddle on an exceptionally undeveloped stretch of river to explore. Beginner paddlers & those who have never paddled here before are welcome.

The paddle will begin promptly at 4:00 P.M. and last about 90 minutes (please arrive early to sign liability forms & hear boat safety/paddle instruction). The paddle is free, but registration is required and spaces are limited to two per town first come first served. To register: contact your Town Administrator. Please direct questions to Al Futterman at [alf@NashuaRiverWatershed.org](mailto:alf@NashuaRiverWatershed.org) or (978) 448-0299

**Do you enjoy recreating on or near our local rivers?**  
Come share your thoughts...we'd like your input to our  
**"Wild & Scenic River" Study**  
**for the Nashua, Squannacook & Nissitissit Rivers**

**Tuesday October 24, 2017 from 7:00 to 8:30PM**  
**Nashua River Watershed Association, 592 Main Street in Groton MA**

The Nashua River Wild & Scenic Study Committee invites you to a public input meeting oriented to river sports enthusiasts & recreational users including anglers, canoeists, hikers, hunters, kayakers, etc....you know who you are!

One of the several "Outstandingly Remarkable Resource Values" that make our three rivers eligible for National Park Service Wild & Scenic status is our recreational opportunities: no one knows these values better than you do. If you share your knowledge & insights with us at this meeting our draft Management Plan will be enhanced: come tell us what you know that is unique & special, & what can be improved.

If you cannot attend please contact us at any time to offer your comments.

For more information see: [www.WildandScenicNashuaRivers.org](http://www.WildandScenicNashuaRivers.org)

Refreshments will be served.

### The Squannacook River: Protecting a jewel in our own backyard

Nashots Publishing Posted 12/08/2017 07:36:35 AM EST

In Townsend and West Groton flows one of the finest rivers in the United States. It is full of trout and a few bass are pulled from all over coming to this area to fish for the prizes found within the river and its tributaries.

The Squannacook River starts in West Townsend and empties its contents some nine miles later into the more beautiful Nashua River. This is a secret no more as thousands upon thousands of tourists come to gaze at its beauty.

The folks in the Nashua River Watershed had by Al Futterman. In here, it's hard to get the river to "wild and scenic" designation. Their 21 page report points out all the reasons why the river should be among the National Wild and Scenic Rivers System, one of the most comprehensive laws ever passed.

The study went over the biodiversity, recreational, scenic historic and cultural aspects of this fine river. One of the positive things they see: Diving in look at the fish and that will be built one spring along the banks.

Also the river can reproduce itself and bass, brook trout can reproduce less and larger brook trout are needed for guides in Worcester. Some bats here eat up to five pounds.

There were two public meetings held this past week about the proposed and citizens gave their thoughts on the project. There were no negative comments, all positive ones, and people added things to help get the project to go forward.

Once this is all completed Futterman and his crew will go to Board of Selectmen in the region and look for approval for them to take this to Town Meeting for approval as well.

If this all goes well it will go on to Washington, DC.

This application will be a joint project for a quarter mile away from the center of the river. The Harbor Pond, now inundated with trees, could get money to help clean out the weeds and repair the river area to what it used to be.

If designated by the president of the United States, it is hoped it will take place by the summer of 2018. This will allow for federal money to come this way to help with river projects.

To see the draft conversation, or to comment, go to [wildandscenicnashuarivers.org](http://wildandscenicnashuarivers.org)

#### Stewardship Plan Being Drafted for the Nashua, Squannacook, and Westfield Rivers Your Input Requested!

Do you care about the biodiversity, history & culture or recreational & scenic opportunities that are here in the Nashua, Squannacook, and Westfield Rivers? Maybe you love to paddle, fish, or hike along these rivers. Maybe you love the variety of wildlife that makes its home in the river and along the banks. Or maybe you love the history of this area, the stories of early inhabitants, the life of the mills, and the story of the Nashua River's rise-up. The Nashua River Wild and Scenic River Study Committee is looking for your input on its draft Stewardship Plan for sections of these three rivers.

As part of the Nashua River Wild and Scenic River Study, this locally driven Stewardship Plan is being drafted for two purposes. One is to provide necessary background information to the National Park Service as part of the process for Partnership Wild and Scenic Rivers designation. The other is to provide guidance to volunteers focused on river stewardship actions going forward.

The incidence of the Nashua, Squannacook, and Westfield Rivers (as well beyond the confines of the rivers' borders) and a number of resources contribute to give these rivers sections regional and national significance. These include:

- Public, permanently protected lands in the "grainary" corner, including private and municipal conservation areas and forests, four state forest, three state wildlife management areas, and other "wild-like" parcels.
- Outstanding fisheries, which are the best in New England and are being improved through water restoration projects.
- High quality biodiversity, including 3 species of rare & cultural resources in close proximity to Boston MA, Worcester MA, and Franklin MA - thus providing local economic stimulus from visitors from these nearby urban centers.
- White-water canoeing and boating opportunities.

A Stewardship Plan for these three rivers is needed, particularly for the Nashua River which is intensively used, because the residents of this region are concerned about maintaining and enhancing the unique resources. According to the draft Plan, citizens are seemingly most concerned about assuring the relatively high water quality, gills that have been declared bad in the river, but that are still good and increasingly becoming better, and more people participating in this locally-driven study to implement support for a concern about to ensure the very resources of the river for future generations.

What's important to you? How can we work together across community lines to conserve and enhance those outstanding resources? Representative from 11 communities in MA and NH are working together on this Plan, and they welcome your input to help make the river as robust as possible. You can [read the draft Stewardship Plan online](#). Please share your comments by email with Al Futterman, Nashua Land Programs Director, at [AlF@NashuaRiverWatershed.org](mailto:AlF@NashuaRiverWatershed.org).

### Do you know and care about the biological, historical and cultural resources on or near our local rivers?

Come share your thoughts...we'd like your input to our

#### "Wild & Scenic River" Study

#### for the Nashua, Squannacook & Nissitissit Rivers

**Tuesday November 28, 2017 from 7:00 to 9:00 PM  
(focused on Biological Diversity resources)**

**Wednesday November 29, 2017 from 7:00 to 9:00 PM  
(focused on Historical and Cultural resources)**

EACH HELD AT

Nashua River Watershed Association, 592 Main Street in Groton MA

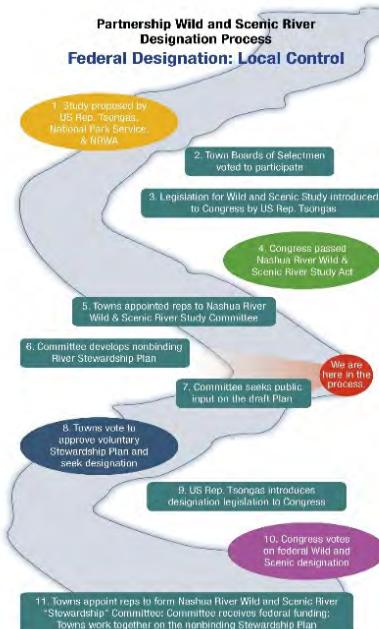

The Nashua River Wild & Scenic River Study Committee invites you to a public input meeting for those who wish to comment on our draft Management Plan. Specifically, two of the "Outstandingly Remarkable Resource Values" that make our rivers eligible for National Park Service Wild & Scenic status are the "biological", and "historic and cultural" resources. Attend the evening that has the focus you are interested in or both. If you share your knowledge & insights with us at these meetings our Plan will be enhanced: come tell us what you know that is unique & special, and what can be improved.

If you cannot attend please contact us at any time to offer your comments.

Pre-registration requested, but not required.
